Overview

Memory management in Python involves a private heap containing all Python objects and data structures. The management of this private heap is ensured internally by the *Python memory manager*. The Python memory manager has different components which deal with various dynamic storage management aspects, like sharing, segmentation, preallocation or caching.

At the lowest level, a raw memory allocator ensures that there is enough room in the private heap for storing all Python-related data by interacting with the memory manager of the operating system. On top of the raw memory allocator, several object-specific allocators operate on the same heap and implement distinct memory management policies adapted to the peculiarities of every object type. For example, integer objects are managed differently within the heap than strings, tuples or dictionaries because integers imply different storage requirements and speed/space tradeoffs. The Python memory manager thus delegates some of the work to the object-specific allocators, but ensures that the latter operate within the bounds of the private heap.

It is important to understand that the management of the Python heap is performed by the interpreter itself and that the user has no control over it, even if they regularly manipulate object pointers to memory blocks inside that heap. The allocation of heap space for Python objects and other internal buffers is performed on demand by the Python memory manager through the Python/C API functions listed in this document.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 43)

Unknown directive type "index".

```
.. index::
   single: malloc()
   single: calloc()
   single: realloc()
   single: free()
```

To avoid memory corruption, extension writers should never try to operate on Python objects with the functions exported by the C library: :c:func:`malloc`, :c:func:`calloc`, :c:func:`realloc` and :c:func:`free`. This will result in mixed calls between the C allocator and the Python memory manager with fatal consequences, because they implement different algorithms and operate on different heaps. However, one may safely allocate and release memory blocks with the C library allocator for individual purposes, as shown in the following example:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 49); *backlink*

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 49); *backlink*

Unknown interpreted text role "c:func".

```
PyObject *res;
char *buf = (char *) malloc(BUFSIZ); /* for I/O */

if (buf == NULL)
    return PyErr_NoMemory();
...Do some I/O operation involving buf...
res = PyBytes_FromString(buf);
free(buf); /* malloc'ed */
return res;
```

In this example, the memory request for the I/O buffer is handled by the C library allocator. The Python memory manager is involved only in the allocation of the bytes object returned as a result.

In most situations, however, it is recommended to allocate memory from the Python heap specifically because the latter is under control of the Python memory manager. For example, this is required when the interpreter is extended with new object types written in C. Another reason for using the Python heap is the desire to *inform* the Python memory manager about the memory needs of the extension module. Even when the requested memory is used exclusively for internal, highly-specific purposes, delegating all memory requests to the Python memory manager causes the interpreter to have a more accurate image of its memory footprint as a whole. Consequently, under certain circumstances, the Python memory manager may or may not trigger appropriate actions, like garbage collection, memory compaction or other preventive procedures. Note that by using the C library allocator as shown in the previous example, the allocated memory for the I/O buffer escapes completely the Python memory manager.

   The :envvar:`PYTHONMALLOC` environment variable can be used to configure
   the memory allocators used by Python.

   The :envvar:`PYTHONMALLOCSTATS` environment variable can be used to print
   statistics of the :ref:`pymalloc memory allocator <pymalloc>` every time a
   new pymalloc object arena is created, and on shutdown.
```

Allocator Domains

All allocating functions belong to one of three different "domains" (see also :c:type:`PyMemAllocatorDomain`). These domains represent different allocation strategies and are optimized for different purposes. The specific details on how every domain allocates memory or what internal functions each domain calls is considered an implementation detail, but for debugging purposes a simplified table can be found at :ref:`here <default-memory-allocators>`. There is no hard requirement to use the memory returned by the allocation functions belonging to a given domain for only the purposes hinted by that domain (although this is the recommended practice). For example, one could use the memory returned by :c:func:`PyMem_RawMalloc` for allocating Python objects or the memory returned by :c:func:`PyObject_Malloc` for allocating memory for buffers.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 98); *backlink*

Unknown interpreted text role "c:type".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 98); *backlink*

Unknown interpreted text role "ref".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 98); *backlink*

Unknown interpreted text role "c:func".

The three allocation domains are:

- Raw domain: intended for allocating memory for general-purpose memory buffers where the allocation *must* go to the system allocator or where the allocator can operate without the :term:`GIL`. The memory is requested directly to the system.

  System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 112); *backlink*

  Unknown interpreted text role "term".

- "Mem" domain: intended for allocating memory for Python buffers and general-purpose memory buffers where the allocation must be performed with the :term:`GIL` held. The memory is taken from the Python private heap.

  System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 117); *backlink*

  Unknown interpreted text role "term".

- Object domain: intended for allocating memory belonging to Python objects. The memory is taken from the Python private heap.

When freeing memory previously allocated by the allocating functions belonging to a given domain,the matching specific deallocating functions must be used. For example, :c:func:`PyMem_Free` must be used to free memory allocated using :c:func:`PyMem_Malloc`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 124); *backlink*

Unknown directive type "c:function".

```
.. c:function:: void PyMem_Free(void *p)

   Frees the memory block pointed to by *p*, which must have been returned by a
   previous call to :c:func:`PyMem_Malloc`, :c:func:`PyMem_Realloc` or
   :c:func:`PyMem_Calloc`.  Otherwise, or if ``PyMem_Free(p)`` has been called
   before, undefined behavior occurs.

   If *p* is ``NULL``, no operation is performed.
```

The following type-oriented macros are provided for convenience. Note that *TYPE* refers to any C type.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 265)

Unknown directive type "c:function".

```
.. c:function:: TYPE* PyMem_New(TYPE, size_t n)

   Same as :c:func:`PyMem_Malloc`, but allocates ``(n * sizeof(TYPE))`` bytes of
   memory.  Returns a pointer cast to :c:type:`TYPE*`.  The memory will not have
   been initialized in any way.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 272)

Unknown directive type "c:function".

```
.. c:function:: TYPE* PyMem_Resize(void *p, TYPE, size_t n)

   Same as :c:func:`PyMem_Realloc`, but the memory block is resized to ``(n *
   sizeof(TYPE))`` bytes.  Returns a pointer cast to :c:type:`TYPE*`. On return,
   *p* will be a pointer to the new memory area, or ``NULL`` in the event of
   failure.

   This is a C preprocessor macro; *p* is always reassigned.  Save the original
   value of *p* to avoid losing memory when handling errors.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 283)

Unknown directive type "c:function".

```
.. c:function:: void PyMem_Del(void *p)

   Same as :c:func:`PyMem_Free`.
```

In addition, the following macro sets are provided for calling the Python memory allocator directly, without involving the C API

functions listed above. However, note that their use does not preserve binary compatibility across Python versions and is therefore deprecated in extension modules.

- `PyMem_MALLOC(size)`
- `PyMem_NEW(type, size)`
- `PyMem_REALLOC(ptr, size)`
- `PyMem_RESIZE(ptr, type, size)`
- `PyMem_FREE(ptr)`
- `PyMem_DEL(ptr)`

Object allocators

The following function sets, modeled after the ANSI C standard, but specifying behavior when requesting zero bytes, are available for allocating and releasing memory from the Python heap.

> **Note**

Unknown directive type "c:function".

```
.. c:function:: void PyMem_GetAllocator(PyMemAllocatorDomain domain, PyMemAllocatorEx *allocator)

   Get the memory block allocator of the specified domain.
```

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 464)

Unknown directive type "c:function".

```
.. c:function:: void PyMem_SetAllocator(PyMemAllocatorDomain domain, PyMemAllocatorEx *allocator)

   Set the memory block allocator of the specified domain.

   The new allocator must return a distinct non-``NULL`` pointer when requesting
   zero bytes.

   For the :c:data:`PYMEM_DOMAIN_RAW` domain, the allocator must be
   thread-safe: the :term:`GIL <global interpreter lock>` is not held when the
   allocator is called.

   If the new allocator is not a hook (does not call the previous allocator),
   the :c:func:`PyMem_SetupDebugHooks` function must be called to reinstall the
   debug hooks on top on the new allocator.

   See also :c:member:`PyPreConfig.allocator` and :ref:`Preinitialize Python
   with PyPreConfig <c-preinit>`.
```

These debug hooks fill dynamically allocated memory blocks with special, recognizable bit patterns. Newly allocated memory is filled with the byte `0xCD` (`PYMEM_CLEANBYTE`), freed memory is filled with the byte `0xDD` (`PYMEM_DEADBYTE`). Memory blocks are surrounded by "forbidden bytes" filled with the byte `0xFD` (`PYMEM_FORBIDDENBYTE`). Strings of these bytes are unlikely to be valid addresses, floats, or ASCII strings.

Runtime checks:

- Detect API violations. For example, detect if :c:func:`PyObject_Free` is called on a memory block allocated by :c:func:`PyMem_Malloc`.

Let *S* = `sizeof(size_t).2*S` bytes are added at each end of each block of *N* bytes requested. The memory layout is like so, where p represents the address returned by a malloc-like or realloc-like function (`p[i:j]` means the slice of bytes from `*(p+i)` inclusive up to `*(p+j)` exclusive; note that the treatment of negative indices differs from a Python slice):

`p[-2*S:-S]`

Number of bytes originally asked for. This is a size_t, big-endian (easier to read in a memory dump).

`p[-S]`

API identifier (ASCII character):

- `'r'` for :c:data:`PYMEM_DOMAIN_RAW`.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 539); backlink

`p[-S+1:0]`

Copies of PYMEM_FORBIDDENBYTE. Used to catch under- writes and reads.

`p[0:N]`

The requested memory, filled with copies of PYMEM_CLEANBYTE, used to catch reference to uninitialized memory. When a realloc-like function is called requesting a larger memory block, the new excess bytes are also filled with PYMEM_CLEANBYTE. When a free-like function is called, these are overwritten with PYMEM_DEADBYTE, to catch reference to freed memory. When a realloc- like function is called requesting a smaller memory block, the excess old bytes are also filled with PYMEM_DEADBYTE.

`p[N:N+S]`

Copies of PYMEM_FORBIDDENBYTE. Used to catch over- writes and reads.

`p[N+S:N+2*S]`

Only used if the `PYMEM_DEBUG_SERIALNO` macro is defined (not defined by default).

A serial number, incremented by 1 on each call to a malloc-like or realloc-like function. Big-endian `size_t`. If "bad memory" is detected later, the serial number gives an excellent way to set a breakpoint on the next run, to capture the instant at which this block was passed out. The static function bumpserialno() in obmalloc.c is the only place the serial number is incremented, and exists so you can set such a breakpoint easily.

A realloc-like or free-like function first checks that the PYMEM_FORBIDDENBYTE bytes at each end are intact. If they've been altered, diagnostic output is written to stderr, and the program is aborted via Py_FatalError(). The other main failure mode is provoking a memory error when a program reads up one of the special bit patterns and tries to use it as an address. If you get in a debugger then and look at the object, you're likely to see that it's entirely filled with PYMEM_DEADBYTE (meaning freed memory is getting used) or PYMEM_CLEANBYTE (meaning uninitialized memory is getting used).

```
.. c:function:: int PyTraceMalloc_Untrack(unsigned int domain, uintptr_t ptr)

   Untrack an allocated memory block in the :mod:`tracemalloc` module.
   Do nothing if the block was not tracked.

   Return ``-2`` if tracemalloc is disabled, otherwise return ``0``.
```

Examples

Here is the example from section :ref:`memoryoverview`, rewritten so that the I/O buffer is allocated from the Python heap by using the first function set:

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\c-api\[cpython-main][Doc][c-api]memory.rst, line 673); *backlink*

Unknown interpreted text role "ref".

```
PyObject *res;
char *buf = (char *) PyMem_Malloc(BUFSIZ); /* for I/O */

if (buf == NULL)
    return PyErr_NoMemory();
/* ...Do some I/O operation involving buf... */
res = PyBytes_FromString(buf);
PyMem_Free(buf); /* allocated with PyMem_Malloc */
return res;
```

The same code using the type-oriented function set:

```
PyObject *res;
char *buf = PyMem_New(char, BUFSIZ); /* for I/O */

if (buf == NULL)
    return PyErr_NoMemory();
/* ...Do some I/O operation involving buf... */
res = PyBytes_FromString(buf);
PyMem_Del(buf); /* allocated with PyMem_New */
return res;
```

Note that in the two examples above, the buffer is always manipulated via functions belonging to the same set. Indeed, it is required to use the same memory API family for a given memory block, so that the risk of mixing different allocators is reduced to a minimum.

The following code sequence contains two errors, one of which is labeled as *fatal* because it mixes two different allocators operating on different heaps.

```
char *buf1 = PyMem_New(char, BUFSIZ);
char *buf2 = (char *) malloc(BUFSIZ);
char *buf3 = (char *) PyMem_Malloc(BUFSIZ);
...
PyMem_Del(buf3);  /* Wrong -- should be PyMem_Free() */
free(buf2);       /* Right -- allocated via malloc() */
free(buf1);       /* Fatal -- should be PyMem_Del()  */
```

In addition to the functions aimed at handling raw memory blocks from the Python heap, objects in Python are allocated and released with :c:func:`PyObject_New`, :c:func:`PyObject_NewVar` and :c:func:`PyObject_Del`.
