

# Security Policy

Security is very important for FastAPI and its community. 🛡️

Learn more about it below. 📌

## Versions

The latest versions of FastAPI are supported.

You are encouraged to [write tests](#) for your application and update your FastAPI version frequently after ensuring that your tests are passing. This way you will benefit from the latest features, bug fixes, and **security fixes**.

You can learn more about [FastAPI versions and how to pin and upgrade them](#) for your project in the docs.

## Reporting a Vulnerability

If you think you found a vulnerability, and even if you are not sure about it, please report it right away by sending an email to: [security@tiangolo.com](mailto:security@tiangolo.com). Please try to be as explicit as possible, describing all the steps and example code to reproduce the security issue.

I (the author, [@tiangolo](#)) will review it thoroughly and get back to you.

## Public Discussions

Please restrain from publicly discussing a potential security vulnerability. 🙊

It's better to discuss privately and try to find a solution first, to limit the potential impact as much as possible.

---

Thanks for your help!

The FastAPI community and I thank you for that. 🙏
