

Self-signed certificates

When running locally, or in other situations that may involve self-signed certificates, you may run into the error: `The request failed with error code "DEPTH_ZERO_SELF_SIGNED_CERT"`.

To solve this, you can disable Node.js' rejection of unauthorized certificates by adding the following to

`.env.development` :

```
NODE_TLS_REJECT_UNAUTHORIZED=0
```

Please note that you need to add `dotenv`, as mentioned in [this guide](#), to expose environment variables in your `gatsby-config.js` or `gatsby-node.js` files.

CAUTION: This should never be set in production. Always ensure that you only enable

`NODE_TLS_REJECT_UNAUTHORIZED` in development with `gatsby develop`.
