

Home > puppeteer > Frame > click

## Frame.click() method

This method clicks the first element found that matches **selector**.

Signature:

```
click(selector: string, options?: {
  delay?: number;
  button?: MouseButton;
  clickCount?: number;
}): Promise<void>;
```

## Parameters

Parameter	Type	Description
selector	string	the selector to search for to click. If there are multiple elements, the first will be clicked.
options	{ delay?: number; button?: MouseButton; clickCount?: number; }	

Returns:

Promise<void>

## Remarks

This method scrolls the element into view if needed, and then uses Page.mouse to click in the center of the element. If there's no element matching **selector**, the method throws an error.

Bear in mind that if **click()** triggers a navigation event and there's a separate **page.waitForNavigation()** promise to be resolved, you may end up with a race condition that yields unexpected results. The correct pattern for click and wait for navigation is the following:

```
const [response] = await Promise.all([
  page.waitForNavigation(waitOptions),
  frame.click(selector, clickOptions),
]);
```
