

# Invalid Custom Route `source`

## Why This Error Occurred

When defining custom routes a route was added that causes an error during parsing. This can be due to trying to use normal `RegExp` syntax like negative lookaheads ( `?!exclude` ) without following `path-to-regexp` 's syntax for it.

## Possible Ways to Fix It

Wrap the `RegExp` part of your `source` as an un-named parameter.

### Before

```
{
  source: '/feedback/(?!general)',
  destination: '/feedback/general'
}
```

### After

```
{
  source: '/feedback/((?!general).*)',
  destination: '/feedback/general'
}
```
