

example.js

This example illustrates how to leverage the `import()` syntax to create ContextModules which are separated into separate chunks for each module in the `./templates` folder.

```
_{{example.js}}_
```

templates/

- foo.js
- baz.js
- bar.js

All templates are of this pattern:

```
_{{templates/foo.js}}_
```

dist/output.js

```
_{{dist/output.js}}_
```

Info

Unoptimized

```
_{{stdout}}_
```

Production mode

```
_{{production:stdout}}_
```
