

This example uses a custom `excerpt_separator`.

You can manually mark in your markdown where to stop excerpting—similar to Jekyll. `gatsby-transformer-remark` uses [gray-matter](#) to parse markdown frontmatter, so you can specify an `excerpt_separator`, as well as any of the other options mentioned [here](#), in the `gatsby-config.js` file.

```
{
  "resolve": `gatsby-transformer-remark`,
  "options": {
    "excerpt_separator": `<!-- end -->`
  }
}
```

Any file that does not have the given `excerpt_separator` will fall back to the default pruning method.
