Unknown interpreted text role "ref".

## Tutorial

This is a short tutorial for using `mod:xml.etree.ElementTree` (ET in short). The goal is to demonstrate some of the building blocks and basic concepts of the module.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 32); [backlink](#)

Unknown interpreted text role "mod".

## XML tree and elements

XML is an inherently hierarchical data format, and the most natural way to represent it is with a tree. ET has two classes for this purpose - `:class:'ElementTree'` represents the whole XML document as a tree, and `:class:'Element'` represents a single node in this tree. Interactions with the whole document (reading and writing to/from files) are usually done on the `:class:'ElementTree'` level. Interactions with a single XML element and its sub-elements are done on the `:class:'Element'` level.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 39); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 39); [backlink](#)

Unknown interpreted text role "class".

Unknown interpreted text role "class".

## Parsing XML

We'll be using the following XML document as the sample data for this section:

```
<?xml version="1.0"?>
<data>
  <country name="Liechtenstein">
    <rank>1</rank>
    <year>2008</year>
    <gdppc>141100</gdppc>
    <neighbor name="Austria" direction="E"/>
    <neighbor name="Switzerland" direction="W"/>
  </country>
  <country name="Singapore">
    <rank>4</rank>
    <year>2011</year>
    <gdppc>59900</gdppc>
    <neighbor name="Malaysia" direction="N"/>
  </country>
  <country name="Panama">
    <rank>68</rank>
```

```
<year>2011</year>
<gdppc>13600</gdppc>
<neighbor name="Costa Rica" direction="W"/>
<neighbor name="Colombia" direction="E"/>
</country>
</data>
```

We can import this data by reading from a file:

```
import xml.etree.ElementTree as ET
tree = ET.parse('country_data.xml')
root = tree.getroot()
```

Or directly from a string:

```
root = ET.fromstring(country_data_as_string)
```

`:func: fromstring` parses XML from a string directly into an `:class: Element`, which is the root element of the parsed tree. Other parsing functions may create an `:class: ElementTree`. Check the documentation to be sure.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 90); [backlink](#)**

Unknown interpreted text role "func".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 90); [backlink](#)**

Unknown interpreted text role "class".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 90); [backlink](#)**

Unknown interpreted text role "class".

As an `:class: Element`, `root` has a tag and a dictionary of attributes:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 94); [backlink](#)**

Unknown interpreted text role "class".

```
>>> root.tag
'data'
>>> root.attrib
{}
```

It also has children nodes over which we can iterate:

```
>>> for child in root:
...     print(child.tag, child.attrib)
...
country {'name': 'Liechtenstein'}
country {'name': 'Singapore'}
country {'name': 'Panama'}
```

Children are nested, and we can access specific child nodes by index:

```
>>> root[0][1].text
'2008'
```

#### Note

Not all elements of the XML input will end up as elements of the parsed tree. Currently, this module skips over any XML comments, processing instructions, and document type declarations in the input. Nevertheless, trees built using this module's API rather than parsing from XML text can have comments and processing instructions in them; they will be included when generating XML output. A document type declaration may be accessed by passing a custom `:class: TreeBuilder` instance to the `:class: XMLParser` constructor.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 118); [backlink](#)**

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 118); [backlink](#)

Unknown interpreted text role "class".

## Pull API for non-blocking parsing

Most parsing functions provided by this module require the whole document to be read at once before returning any result. It is possible to use an `class:XMLParser` and feed data into it incrementally, but it is a push API that calls methods on a callback target, which is too low-level and inconvenient for most needs. Sometimes what the user really wants is to be able to parse XML incrementally, without blocking operations, while enjoying the convenience of fully constructed `class:Element` objects.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 134); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 134); [backlink](#)

Unknown interpreted text role "class".

The most powerful tool for doing this is `class:XMLPullParser`. It does not require a blocking read to obtain the XML data, and is instead fed with data incrementally with `meth:XMLPullParser.feed` calls. To get the parsed XML elements, call `meth:XMLPullParser.read_events`. Here is an example:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 142); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 142); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 142); [backlink](#)

Unknown interpreted text role "meth".

```
>>> parser = ET.XMLPullParser(['start', 'end'])
>>> parser.feed('<mytag>sometext')
>>> list(parser.read_events())
[('start', <Element 'mytag' at 0x7fa66db2be58>)]
>>> parser.feed(' more text</mytag>')
>>> for event, elem in parser.read_events():
...     print(event)
...     print(elem.tag, 'text=', elem.text)
...
end
```

The obvious use case is applications that operate in a non-blocking fashion where the XML data is being received from a socket or read incrementally from some storage device. In such cases, blocking reads are unacceptable.

Because it's so flexible, `class:XMLPullParser` can be inconvenient to use for simpler use-cases. If you don't mind your application blocking on reading XML data but would still like to have incremental parsing capabilities, take a look at `func:iterparse`. It can be useful when you're reading a large XML document and don't want to hold it wholly in memory.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 162); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 162); [backlink](#)

Unknown interpreted text role "func".

## Finding interesting elements

`:class:'Element'` has some useful methods that help iterate recursively over all the sub-tree below it (its children, their children, and so on). For example, `:meth:'Element.iter'`:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 171); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 171); [backlink](#)

Unknown interpreted text role "meth".

```
>>> for neighbor in root.iter('neighbor'):
...     print(neighbor.attrib)
...
{'name': 'Austria', 'direction': 'E'}
{'name': 'Switzerland', 'direction': 'W'}
{'name': 'Malaysia', 'direction': 'N'}
{'name': 'Costa Rica', 'direction': 'W'}
{'name': 'Colombia', 'direction': 'E'}
```

`:meth:'Element.findall'` finds only elements with a tag which are direct children of the current element. `:meth:'Element.find'` finds the *first* child with a particular tag, and `:attr:'Element.text'` accesses the element's text content. `:meth:'Element.get'` accesses the element's attributes:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 184); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 184); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 184); [backlink](#)

Unknown interpreted text role "attr".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 184); [backlink](#)

Unknown interpreted text role "meth".

```
>>> for country in root.findall('country'):
...     rank = country.find('rank').text
...     name = country.get('name')
...     print(name, rank)
...
Liechtenstein 1
Singapore 4
Panama 68
```

More sophisticated specification of which elements to look for is possible by using `:ref:'XPath <elementtree-xpath>'`.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 198); [backlink](#)

Unknown interpreted text role "ref".

## Modifying an XML File

`class: 'ElementTree'` provides a simple way to build XML documents and write them to files. The `meth: 'ElementTree.write'` method serves this purpose.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 204); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 204); [backlink](#)

Unknown interpreted text role "meth".

Once created, an `class: 'Element'` object may be manipulated by directly changing its fields (such as `attr: 'Element.text'`), adding and modifying attributes (`meth: 'Element.set'` method), as well as adding new children (for example with `meth: 'Element.append'`).

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 207); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 207); [backlink](#)

Unknown interpreted text role "attr".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 207); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 207); [backlink](#)

Unknown interpreted text role "meth".

Let's say we want to add one to each country's rank, and add an `updated` attribute to the rank element:

```
>>> for rank in root.iter('rank'):
...     new_rank = int(rank.text) + 1
...     rank.text = str(new_rank)
...     rank.set('updated', 'yes')
...
>>> tree.write('output.xml')
```

Our XML now looks like this:

```
<?xml version="1.0"?>
<data>
  <country name="Liechtenstein">
    <rank updated="yes">2</rank>
    <year>2008</year>
    <gdppc>141100</gdppc>
    <neighbor name="Austria" direction="E"/>
    <neighbor name="Switzerland" direction="W"/>
  </country>
  <country name="Singapore">
    <rank updated="yes">5</rank>
    <year>2011</year>
    <gdppc>59900</gdppc>
    <neighbor name="Malaysia" direction="N"/>
  </country>
  <country name="Panama">
    <rank updated="yes">69</rank>
    <year>2011</year>
    <gdppc>13600</gdppc>
    <neighbor name="Costa Rica" direction="W"/>
    <neighbor name="Colombia" direction="E"/>
  </country>
</data>
```

We can remove elements using `meth:Element.remove`. Let's say we want to remove all countries with a rank higher than 50:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 250); [backlink](#)  
Unknown interpreted text role "meth".

```
>>> for country in root.findall('country'):
...     # using root.findall() to avoid removal during traversal
...     rank = int(country.find('rank').text)
...     if rank > 50:
...         root.remove(country)
...
>>> tree.write('output.xml')
```

Note that concurrent modification while iterating can lead to problems, just like when iterating and modifying Python lists or dicts. Therefore, the example first collects all matching elements with `root.findall()`, and only then iterates over the list of matches.

Our XML now looks like this:

```
<?xml version="1.0"?>
<data>
  <country name="Liechtenstein">
    <rank updated="yes">2</rank>
    <year>2008</year>
    <gdppc>141100</gdppc>
    <neighbor name="Austria" direction="E"/>
    <neighbor name="Switzerland" direction="W"/>
  </country>
  <country name="Singapore">
    <rank updated="yes">5</rank>
    <year>2011</year>
    <gdppc>59900</gdppc>
    <neighbor name="Malaysia" direction="N"/>
  </country>
</data>
```

## Building XML documents

The `func:SubElement` function also provides a convenient way to create new sub-elements for a given element:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 290); [backlink](#)  
Unknown interpreted text role "func".

```
>>> a = ET.Element('a')
>>> b = ET.SubElement(a, 'b')
>>> c = ET.SubElement(a, 'c')
>>> d = ET.SubElement(c, 'd')
>>> ET.dump(a)
<a><b /><c><d /></c></a>
```

## Parsing XML with Namespaces

If the XML input has [namespaces](#), tags and attributes with prefixes in the form `prefix:sometag` get expanded to `{uri}sometag` where the *prefix* is replaced by the full *URI*. Also, if there is a [default namespace](#), that full URI gets prepended to all of the non-prefixed tags.

Here is an XML example that incorporates two namespaces, one with the prefix "fictional" and the other serving as the default namespace:

```
<?xml version="1.0"?>
<actors xmlns:fictional="http://characters.example.com"
  xmlns="http://people.example.com">
  <actor>
    <name>John Cleese</name>
    <fictional:character>Lancelot</fictional:character>
    <fictional:character>Archie Leach</fictional:character>
  </actor>
  <actor>
    <name>Eric Idle</name>
    <fictional:character>Sir Robin</fictional:character>
    <fictional:character>Gunther</fictional:character>
    <fictional:character>Commander Clement</fictional:character>
  </actor>
</actors>
```

One way to search and explore this XML example is to manually add the URI to every tag or attribute in the xpath of a `meth:~Element.find` or `meth:~Element.findall`:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 332); [backlink](#)**

Unknown interpreted text role "meth".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 332); [backlink](#)**

Unknown interpreted text role "meth".

```
root = fromstring(xml_text)
for actor in root.findall('{http://people.example.com}actor'):
    name = actor.find('{http://people.example.com}name')
    print(name.text)
    for char in actor.findall('{http://characters.example.com}character'):
        print(' |-->', char.text)
```

A better way to search the namespaced XML example is to create a dictionary with your own prefixes and use those in the search functions:

```
ns = {'real_person': 'http://people.example.com',
      'role': 'http://characters.example.com'}

for actor in root.findall('real_person:actor', ns):
    name = actor.find('real_person:name', ns)
    print(name.text)
    for char in actor.findall('role:character', ns):
        print(' |-->', char.text)
```

These two approaches both output:

```
John Cleese
 |--> Lancelot
 |--> Archie Leach
Eric Idle
 |--> Sir Robin
 |--> Gunther
 |--> Commander Clement
```

## XPath support

This module provides limited support for [XPath expressions](#) for locating elements in a tree. The goal is to support a small subset of the abbreviated syntax; a full XPath engine is outside the scope of the module.

### Example

Here's an example that demonstrates some of the XPath capabilities of the module. We'll be using the `countrydata` XML document from the [ref: Parsing XML <elementtree-parsing-xml>](#) section:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 379); [backlink](#)**

Unknown interpreted text role "ref".

```
import xml.etree.ElementTree as ET

root = ET.fromstring(countrydata)

# Top-level elements
root.findall(".")

# All 'neighbor' grand-children of 'country' children of the top-level
# elements
root.findall("./country/neighbor")

# Nodes with name='Singapore' that have a 'year' child
root.findall("./year/..[@name='Singapore']")

# 'year' nodes that are children of nodes with name='Singapore'
root.findall("./*[@name='Singapore']/year")

# All 'neighbor' nodes that are the second child of their parent
```

```
root.findall("./neighbor[2]")
```

For XML with namespaces, use the usual qualified {namespace}tag notation:

```
# All dublin-core "title" tags in the document
root.findall("./{http://purl.org/dc/elements/1.1/}title")
```

## Supported XPath syntax

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 412)**

Unknown directive type "tabularcolumns".

```
.. tabularcolumns:: |l|L|
```

Syntax	Meaning
tag	<p>Selects all child elements with the given tag. For example, spam selects all child elements named spam, and spam/egg selects all grandchildren named egg in all children named spam. {namespace}* selects all tags in the given namespace, {*}spam selects tags named spam in any (or no) namespace, and {}* only selects tags that are not in a namespace.</p> <div><p><b>System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 427)</b></p><p>Unknown directive type "versionchanged".</p><pre>.. versionchanged:: 3.8    Support for star-wildcards was added.</pre></div>
*	Selects all child elements, including comments and processing instructions. For example, */egg selects all grandchildren named egg.
.	Selects the current node. This is mostly useful at the beginning of the path, to indicate that it's a relative path.
//	Selects all subelements, on all levels beneath the current element. For example, ./egg selects all egg elements in the entire tree.
..	Selects the parent element. Returns None if the path attempts to reach the ancestors of the start element (the element find was called on).
[@attrib]	Selects all elements that have the given attribute.
[@attrib='value']	Selects all elements for which the given attribute has the given value. The value cannot contain quotes.
[@attrib!='value']	Selects all elements for which the given attribute does not have the given value. The value cannot contain quotes.
[tag]	Selects all elements that have a child named tag. Only immediate children are supported.
[.='text']	<p>Selects all elements whose complete text content, including descendants, equals the given text.</p> <div><p><b>System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 464)</b></p><p>Unknown directive type "versionadded".</p><pre>.. versionadded:: 3.7</pre></div>

Syntax	Meaning
[.!='text']	<p>Selects all elements whose complete text content, including descendants, does not equal the given <code>text</code>.</p> <div> <p><b>System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\cpython-main) [Doc] [library]xml.etree.elementtree.rst, line 470)</b></p> <p>Unknown directive type "versionadded".</p> <pre>.. versionadded:: 3.10</pre> </div>
[tag='text']	Selects all elements that have a child named <code>tag</code> whose complete text content, including descendants, equals the given <code>text</code> .
[tag!='text']	<p>Selects all elements that have a child named <code>tag</code> whose complete text content, including descendants, does not equal the given <code>text</code>.</p> <div> <p><b>System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\cpython-main) [Doc] [library]xml.etree.elementtree.rst, line 480)</b></p> <p>Unknown directive type "versionadded".</p> <pre>.. versionadded:: 3.10</pre> </div>
[position]	Selects all elements that are located at the given position. The position can be either an integer (1 is the first position), the expression <code>last()</code> (for the last position), or a position relative to the last position (e.g. <code>last()-1</code> ).

Predicates (expressions within square brackets) must be preceded by a tag name, an asterisk, or another predicate. `position` predicates must be preceded by a tag name.

## Reference

### Functions

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\cpython-main) [Doc] [library]xml.etree.elementtree.rst, line 500)**

Unknown directive type "function".

```
.. function:: canonicalize(xml_data=None, *, out=None, from_file=None, **options)
```

```
`C14N 2.0 <https://www.w3.org/TR/xml-c14n2/>`_ transformation function.
```

Canonicalization is a way to normalise XML output in a way that allows byte-by-byte comparisons and digital signatures. It reduced the freedom that XML serializers have and instead generates a more constrained XML representation. The main restrictions regard the placement of namespace declarations, the ordering of attributes, and ignorable whitespace.

This function takes an XML data string (`*xml_data*`) or a file path or file-like object (`*from_file*`) as input, converts it to the canonical form, and writes it out using the `*out*` file(-like) object, if provided, or returns it as a text string if not. The output file receives text, not bytes. It should therefore be opened in text mode with ```utf-8``` encoding.

Typical uses::

```
xml_data = "<root>...</root>"
print(canonicalize(xml_data))
```

```
with open("c14n_output.xml", mode='w', encoding='utf-8') as out_file:
    canonicalize(xml_data, out=out_file)
```

```
with open("c14n_output.xml", mode='w', encoding='utf-8') as out_file:
    canonicalize(from_file="inputfile.xml", out=out_file)
```

The configuration `*options*` are as follows:

- `*with_comments*`: set to true to include comments (default: false)

- `*strip_text*`: set to true to strip whitespace before and after text content (default: false)
- `*rewrite_prefixes*`: set to true to replace namespace prefixes by "n{number}" (default: false)
- `*qname_aware_tags*`: a set of qname aware tag names in which prefixes should be replaced in text content (default: empty)
- `*qname_aware_attrs*`: a set of qname aware attribute names in which prefixes should be replaced in text content (default: empty)
- `*exclude_attrs*`: a set of attribute names that should not be serialised
- `*exclude_tags*`: a set of tag names that should not be serialised

In the option list above, "a set" refers to any collection or iterable of strings, no ordering is expected.

.. versionadded:: 3.8

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 548)**

Unknown directive type "function".

```
.. function:: Comment(text=None)
```

Comment element factory. This factory function creates a special element that will be serialized as an XML comment by the standard serializer. The comment string can be either a bytestring or a Unicode string. `*text*` is a string containing the comment string. Returns an element instance representing a comment.

Note that `:class:`XMLParser`` skips over comments in the input instead of creating comment objects for them. An `:class:`ElementTree`` will only contain comment nodes if they have been inserted into to the tree using one of the `:class:`Element`` methods.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 561)**

Unknown directive type "function".

```
.. function:: dump(elem)
```

Writes an element tree or element structure to `sys.stdout`. This function should be used for debugging only.

The exact output format is implementation dependent. In this version, it's written as an ordinary XML file.

`*elem*` is an element tree or an individual element.

```
.. versionchanged:: 3.8
   The :func:`dump` function now preserves the attribute order specified
   by the user.
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 576)**

Unknown directive type "function".

```
.. function:: fromstring(text, parser=None)
```

Parses an XML section from a string constant. Same as `:func:`XML``. `*text*` is a string containing XML data. `*parser*` is an optional parser instance. If not given, the standard `:class:`XMLParser`` parser is used. Returns an `:class:`Element`` instance.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 584)**

Unknown directive type "function".

```
.. function:: fromstringlist(sequence, parser=None)
```

Parses an XML document from a sequence of string fragments. *\*sequence\** is a list or other sequence containing XML data fragments. *\*parser\** is an optional parser instance. If not given, the standard `:class:`XMLParser`` parser is used. Returns an `:class:`Element`` instance.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 594)**

Unknown directive type "function".

```
.. function:: indent(tree, space=" ", level=0)
```

Appends whitespace to the subtree to indent the tree visually. This can be used to generate pretty-printed XML output. *\*tree\** can be an `Element` or `ElementTree`. *\*space\** is the whitespace string that will be inserted for each indentation level, two space characters by default. For indenting partial subtrees inside of an already indented tree, pass the initial indentation level as *\*level\**.

```
.. versionadded:: 3.9
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 606)**

Unknown directive type "function".

```
.. function:: iselement(element)
```

Check if an object appears to be a valid element object. *\*element\** is an element instance. Return ```True``` if this is an element object.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 612)**

Unknown directive type "function".

```
.. function:: iterparse(source, events=None, parser=None)
```

Parses an XML section into an element tree incrementally, and reports what's going on to the user. *\*source\** is a filename or `:term:`file object`` containing XML data. *\*events\** is a sequence of events to report back. The supported events are the strings ```"start"```, ```"end"```, ```"comment"```, ```"pi"```, ```"start-ns"``` and ```"end-ns"``` (the "ns" events are used to get detailed namespace information). If *\*events\** is omitted, only ```"end"``` events are reported. *\*parser\** is an optional parser instance. If not given, the standard `:class:`XMLParser`` parser is used. *\*parser\** must be a subclass of `:class:`XMLParser`` and can only use the default `:class:`TreeBuilder`` as a target. Returns an `:term:`iterator`` providing ```(event, elem)``` pairs.

Note that while `:func:`iterparse`` builds the tree incrementally, it issues blocking reads on *\*source\** (or the file it names). As such, it's unsuitable for applications where blocking reads can't be made. For fully non-blocking parsing, see `:class:`XMLPullParser``.

```
.. note::
```

`:func:`iterparse`` only guarantees that it has seen the `">"` character of a starting tag when it emits a `"start"` event, so the attributes are defined, but the contents of the text and tail attributes are undefined at that point. The same applies to the element children; they may or may not be present.

If you need a fully populated element, look for `"end"` events instead.

```
.. deprecated:: 3.4
```

The *\*parser\** argument.

```
.. versionchanged:: 3.8
    The ``comment`` and ``pi`` events were added.
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 648)**

Unknown directive type "function".

```
.. function:: parse(source, parser=None)
```

Parses an XML section into an element tree. *\*source\** is a filename or file object containing XML data. *\*parser\** is an optional parser instance. If not given, the standard `:class:`XMLParser`` parser is used. Returns an `:class:`ElementTree`` instance.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 656)**

Unknown directive type "function".

```
.. function:: ProcessingInstruction(target, text=None)
```

PI element factory. This factory function creates a special element that will be serialized as an XML processing instruction. *\*target\** is a string containing the PI target. *\*text\** is a string containing the PI contents, if given. Returns an element instance, representing a processing instruction.

Note that `:class:`XMLParser`` skips over processing instructions in the input instead of creating comment objects for them. An `:class:`ElementTree`` will only contain processing instruction nodes if they have been inserted into the tree using one of the `:class:`Element`` methods.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 669)**

Unknown directive type "function".

```
.. function:: register_namespace(prefix, uri)
```

Registers a namespace prefix. The registry is global, and any existing mapping for either the given prefix or the namespace URI will be removed. *\*prefix\** is a namespace prefix. *\*uri\** is a namespace uri. Tags and attributes in this namespace will be serialized with the given prefix, if at all possible.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 680)**

Unknown directive type "function".

```
.. function:: SubElement(parent, tag, attrib={}, **extra)
```

Subelement factory. This function creates an element instance, and appends it to an existing element.

The element name, attribute names, and attribute values can be either bytestrings or Unicode strings. *\*parent\** is the parent element. *\*tag\** is the subelement name. *\*attrib\** is an optional dictionary, containing element attributes. *\*extra\** contains additional attributes, given as keyword arguments. Returns an element instance.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 692)**

Unknown directive type "function".

```
.. function:: tostring(element, encoding="us-ascii", method="xml", *, \
                        xml_declaration=None, default_namespace=None, \
                        short_empty_elements=True)
```

Generates a string representation of an XML element, including all subelements. *\*element\** is an `:class:`Element`` instance. *\*encoding\** [1]\_ is the output encoding (default is US-ASCII). Use ```encoding="unicode"``` to generate a Unicode string (otherwise, a bytestring is generated). *\*method\** is either ```"xml"```, ```"html"``` or ```"text"``` (default is ```"xml"```). *\*xml\_declaration\**, *\*default\_namespace\** and *\*short\_empty\_elements\** has the same meaning as in `:meth:`ElementTree.write``. Returns an (optionally) encoded string containing the XML data.

```
.. versionadded:: 3.4
    The *short_empty_elements* parameter.

.. versionadded:: 3.8
    The *xml_declaration* and *default_namespace* parameters.

.. versionchanged:: 3.8
    The :func:`tostring` function now preserves the attribute order
    specified by the user.
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 716)**

Unknown directive type "function".

```
.. function:: tostringlist(element, encoding="us-ascii", method="xml", *, \
                           xml_declaration=None, default_namespace=None, \
                           short_empty_elements=True)
```

Generates a string representation of an XML element, including all subelements. *\*element\** is an `:class:`Element`` instance. *\*encoding\** [1]\_ is the output encoding (default is US-ASCII). Use ```encoding="unicode"``` to generate a Unicode string (otherwise, a bytestring is generated). *\*method\** is either ```"xml"```, ```"html"``` or ```"text"``` (default is ```"xml"```). *\*xml\_declaration\**, *\*default\_namespace\** and *\*short\_empty\_elements\** has the same meaning as in `:meth:`ElementTree.write``. Returns a list of (optionally) encoded strings containing the XML data. It does not guarantee any specific sequence, except that ```b"".join(tostringlist(element)) == tostring(element)```.

```
.. versionadded:: 3.2

.. versionadded:: 3.4
    The *short_empty_elements* parameter.

.. versionadded:: 3.8
    The *xml_declaration* and *default_namespace* parameters.

.. versionchanged:: 3.8
    The :func:`tostringlist` function now preserves the attribute order
    specified by the user.
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 743)**

Unknown directive type "function".

```
.. function:: XML(text, parser=None)
```

Parses an XML section from a string constant. This function can be used to embed "XML literals" in Python code. *\*text\** is a string containing XML data. *\*parser\** is an optional parser instance. If not given, the standard `:class:`XMLParser`` parser is used. Returns an `:class:`Element`` instance.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 751)**

Unknown directive type "function".

```
.. function:: XMLID(text, parser=None)
```

Parses an XML section from a string constant, and also returns a dictionary which maps from element id:s to elements. \*text\* is a string containing XML data. \*parser\* is an optional parser instance. If not given, the standard :class:`XMLParser` parser is used. Returns a tuple containing an :class:`Element` instance and a dictionary.

## XInclude support

This module provides limited support for [XInclude directives](#), via the :mod:`xml.etree.ElementInclude` helper module. This module can be used to insert subtrees and text strings into element trees, based on information in the tree.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 765); [backlink](#)

Unknown interpreted text role "mod".

### Example

Here's an example that demonstrates use of the XInclude module. To include an XML document in the current document, use the {http://www.w3.org/2001/XInclude}include element and set the **parse** attribute to "xml", and use the **href** attribute to specify the document to include.

```
<?xml version="1.0"?>
<document xmlns:xi="http://www.w3.org/2001/XInclude">
  <xi:include href="source.xml" parse="xml" />
</document>
```

By default, the **href** attribute is treated as a file name. You can use custom loaders to override this behaviour. Also note that the standard helper does not support XPointer syntax.

To process this file, load it as usual, and pass the root element to the :mod:`xml.etree.ElementTree` module:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 782); [backlink](#)

Unknown interpreted text role "mod".

```
from xml.etree import ElementTree, ElementInclude

tree = ElementTree.parse("document.xml")
root = tree.getroot()

ElementInclude.include(root)
```

The ElementInclude module replaces the {http://www.w3.org/2001/XInclude}include element with the root element from the **source.xml** document. The result might look something like this:

```
<document xmlns:xi="http://www.w3.org/2001/XInclude">
  <para>This is a paragraph.</para>
</document>
```

If the **parse** attribute is omitted, it defaults to "xml". The href attribute is required.

To include a text document, use the {http://www.w3.org/2001/XInclude}include element, and set the **parse** attribute to "text".

```
<?xml version="1.0"?>
<document xmlns:xi="http://www.w3.org/2001/XInclude">
  Copyright (c) <xi:include href="year.txt" parse="text" />.
</document>
```

The result might look something like:

```
<document xmlns:xi="http://www.w3.org/2001/XInclude">
  Copyright (c) 2003.
</document>
```

## Reference

## Functions

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 828)**

Unknown directive type "function".

```
.. function:: xml.etree.ElementInclude.default_loader( href, parse, encoding=None)
```

Default loader. This default loader reads an included resource from disk. *\*href\** is a URL. *\*parse\** is for parse mode either "xml" or "text". *\*encoding\** is an optional text encoding. If not given, encoding is ``utf-8``. Returns the expanded resource. If the parse mode is ``"xml"`` , this is an ElementTree instance. If the parse mode is "text", this is a Unicode string. If the loader fails, it can return None or raise an exception.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 838)**

Unknown directive type "function".

```
.. function:: xml.etree.ElementInclude.include( elem, loader=None, base_url=None, \
                                              max_depth=6)
```

This function expands XInclude directives. *\*elem\** is the root element. *\*loader\** is an optional resource loader. If omitted, it defaults to :func:`default\_loader`. If given, it should be a callable that implements the same interface as :func:`default\_loader`. *\*base\_url\** is base URL of the original file, to resolve relative include file references. *\*max\_depth\** is the maximum number of recursive inclusions. Limited to reduce the risk of malicious content explosion. Pass a negative value to disable the limitation.

Returns the expanded resource. If the parse mode is ``"xml"`` , this is an ElementTree instance. If the parse mode is "text", this is a Unicode string. If the loader fails, it can return None or raise an exception.

```
.. versionadded:: 3.9
   The *base_url* and *max_depth* parameters.
```

## Element Objects

Element class. This class defines the Element interface, and provides a reference implementation of this interface.

The element name, attribute names, and attribute values can be either bytestrings or Unicode strings. *tag* is the element name. *attrib* is an optional dictionary, containing element attributes. *extra* contains additional attributes, given as keyword arguments.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 874)**

Unknown directive type "attribute".

```
.. attribute:: tag
```

A string identifying what kind of data this element represents (the element type, in other words).

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 880)**

Unknown directive type "attribute".

```
.. attribute:: text
               tail
```

These attributes can be used to hold additional data associated with the element. Their values are usually strings but may be any application-specific object. If the element is created from an XML file, the *\*text\** attribute holds either the text between the element's start tag and its first child or end tag, or ``None``, and the *\*tail\** attribute holds either the text between the element's

end tag and the next tag, or ``None``. For the XML data

```
.. code-block:: xml
```

```
<a><b>1<c>2<d/>3</c></b>4</a>
```

the *a* element has ``None`` for both *text* and *tail* attributes, the *b* element has *text* ``"1"`` and *tail* ``"4"`` , the *c* element has *text* ``"2"`` and *tail* ``None`` , and the *d* element has *text* ``None`` and *tail* ``"3"`` .

To collect the inner text of an element, see :meth:`iterertext`, for example `"".join(element.iterertext())`.

Applications may store arbitrary objects in these attributes.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 906)**

Unknown directive type "attribute".

```
.. attribute:: attrib
```

A dictionary containing the element's attributes. Note that while the *attrib* value is always a real mutable Python dictionary, an ElementTree implementation may choose to use another internal representation, and create the dictionary only if someone asks for it. To take advantage of such implementations, use the dictionary methods below whenever possible.

The following dictionary-like methods work on the element attributes.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 917)**

Unknown directive type "method".

```
.. method:: clear()
```

Resets an element. This function removes all subelements, clears all attributes, and sets the text and tail attributes to ``None``.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 923)**

Unknown directive type "method".

```
.. method:: get(key, default=None)
```

Gets the element attribute named *key*.

Returns the attribute value, or *default* if the attribute was not found.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 930)**

Unknown directive type "method".

```
.. method:: items()
```

Returns the element attributes as a sequence of (name, value) pairs. The attributes are returned in an arbitrary order.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\ [cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 936)**

Unknown directive type "method".

```
.. method:: keys()
```

Returns the elements attribute names as a list. The names are returned in an arbitrary order.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 942)**

Unknown directive type "method".

```
.. method:: set(key, value)
```

Set the attribute *\*key\** on the element to *\*value\**.

The following methods work on the element's children (subelements).

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 949)**

Unknown directive type "method".

```
.. method:: append(subelement)
```

Adds the element *\*subelement\** to the end of this element's internal list of subelements. Raises :exc:`TypeError` if *\*subelement\** is not an :class:`Element`.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 956)**

Unknown directive type "method".

```
.. method:: extend(subelements)
```

Appends *\*subelements\** from a sequence object with zero or more elements. Raises :exc:`TypeError` if a subelement is not an :class:`Element`.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 964)**

Unknown directive type "method".

```
.. method:: find(match, namespaces=None)
```

Finds the first subelement matching *\*match\**. *\*match\** may be a tag name or a :ref:`path <elementtree-xpath>`. Returns an element instance or ``None``. *\*namespaces\** is an optional mapping from namespace prefix to full name. Pass ``''`` as prefix to move all unprefix tag names in the expression into the given namespace.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 973)**

Unknown directive type "method".

```
.. method:: findall(match, namespaces=None)
```

Finds all matching subelements, by tag name or :ref:`path <elementtree-xpath>`. Returns a list containing all matching elements in document order. *\*namespaces\** is an optional mapping from namespace prefix to full name. Pass ``''`` as prefix to move all unprefix tag names in the expression into the given namespace.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 982)**

Unknown directive type "method".

```
.. method:: findtext(match, default=None, namespaces=None)
```

Finds text for the first subelement matching *\*match\**. *\*match\** may be a tag name or a `:ref:\path <elementtree-xpath>`. Returns the text content of the first matching element, or *\*default\** if no element was found. Note that if the matching element has no text content an empty string is returned. *\*namespaces\** is an optional mapping from namespace prefix to full name. Pass `''''` as prefix to move all unprefix tag names in the expression into the given namespace.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 993)**

Unknown directive type "method".

```
.. method:: insert(index, subelement)
```

Inserts *\*subelement\** at the given position in this element. Raises `:exc:`TypeError`` if *\*subelement\** is not an `:class:`Element``.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 999)**

Unknown directive type "method".

```
.. method:: iter(tag=None)
```

Creates a tree `:term:`iterator`` with the current element as the root. The iterator iterates over this element and all elements below it, in document (depth first) order. If *\*tag\** is not ```None``` or ```'*'```, only elements whose tag equals *\*tag\** are returned from the iterator. If the tree structure is modified during iteration, the result is undefined.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1010)**

Unknown directive type "method".

```
.. method:: iterfind(match, namespaces=None)
```

Finds all matching subelements, by tag name or `:ref:\path <elementtree-xpath>`. Returns an iterable yielding all matching elements in document order. *\*namespaces\** is an optional mapping from namespace prefix to full name.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1021)**

Unknown directive type "method".

```
.. method:: itertext()
```

Creates a text iterator. The iterator loops over this element and all subelements, in document order, and returns all inner text.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1029)

Unknown directive type "method".

```
.. method:: makeelement(tag, attrib)
```

Creates a new element object of the same type as this element. Do not call this method, use the :func:`SubElement` factory function instead.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1035)

Unknown directive type "method".

```
.. method:: remove(subelement)
```

Removes \*subelement\* from the element. Unlike the find\\* methods this method compares elements based on the instance identity, not on tag value or contents.

:class:`Element` objects also support the following sequence type methods for working with subelements:

:meth:`~object.\_\_delitem\_\_`, :meth:`~object.\_\_getitem\_\_`, :meth:`~object.\_\_setitem\_\_`, :meth:`~object.\_\_len\_\_`.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1041); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1041); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1041); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1041); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1041); [backlink](#)

Unknown interpreted text role "meth".

Caution: Elements with no subelements will test as `False`. This behavior will change in future versions. Use specific `len(elem)` or `elem is None` test instead.

```
element = root.find('foo')

if not element: # careful!
    print("element not found, or element has no subelements")

if element is None:
    print("element not found")
```

Prior to Python 3.8, the serialisation order of the XML attributes of elements was artificially made predictable by sorting the attributes by their name. Based on the now guaranteed ordering of dicts, this arbitrary reordering was removed in Python 3.8 to preserve the order in which attributes were originally parsed or created by user code.

In general, user code should try not to depend on a specific ordering of attributes, given that the [XML Information Set](#) explicitly excludes the attribute order from conveying information. Code should be prepared to deal with any ordering on input. In cases where deterministic XML output is required, e.g. for cryptographic signing or test data sets, canonical serialisation is available with the :func:`canonicalize` function.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1064); [backlink](#)**

Unknown interpreted text role "func".

In cases where canonical output is not applicable but a specific attribute order is still desirable on output, code should aim for creating the attributes directly in the desired order, to avoid perceptual mismatches for readers of the code. In cases where this is difficult to achieve, a recipe like the following can be applied prior to serialisation to enforce an order independently from the Element creation:

```
def reorder_attributes(root):
    for el in root.iter():
        attrib = el.attrib
        if len(attrib) > 1:
            # adjust attribute order, e.g. by sorting
            attribs = sorted(attrib.items())
            attrib.clear()
            attrib.update(attribs)
```

## ElementTree Objects

ElementTree wrapper class. This class represents an entire element hierarchy, and adds some extra support for serialization to and from standard XML.

*element* is the root element. The tree is initialized with the contents of the XML *file* if given.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1105)**

Unknown directive type "method".

```
.. method:: _setroot(element)
```

Replaces the root element for this tree. This discards the current contents of the tree, and replaces it with the given element. Use with care. \*element\* is an element instance.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1112)**

Unknown directive type "method".

```
.. method:: find(match, namespaces=None)
```

Same as :meth:`Element.find`, starting at the root of the tree.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1117)**

Unknown directive type "method".

```
.. method:: findall(match, namespaces=None)
```

Same as :meth:`Element.findall`, starting at the root of the tree.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1122)**

Unknown directive type "method".

```
.. method:: findtext(match, default=None, namespaces=None)
```

Same as :meth:`Element.findtext`, starting at the root of the tree.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1127)**

Unknown directive type "method".

```
.. method:: getroot()
```

Returns the root element for this tree.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1132)**

Unknown directive type "method".

```
.. method:: iter(tag=None)
```

Creates and returns a tree iterator for the root element. The iterator loops over all elements in this tree, in section order. \*tag\* is the tag to look for (default is to return all elements).

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1139)**

Unknown directive type "method".

```
.. method:: iterfind(match, namespaces=None)
```

Same as :meth:`Element.iterfind`, starting at the root of the tree.

```
.. versionadded:: 3.2
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1146)**

Unknown directive type "method".

```
.. method:: parse(source, parser=None)
```

Loads an external XML section into this element tree. \*source\* is a file name or :term:`file object`. \*parser\* is an optional parser instance. If not given, the standard :class:`XMLParser` parser is used. Returns the section root element.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main][Doc][library]xml.etree.elementtree.rst, line 1154)**

Unknown directive type "method".

```
.. method:: write(file, encoding="us-ascii", xml_declaration=None, \
                  default_namespace=None, method="xml", *, \
                  short_empty_elements=True)
```

Writes the element tree to a file, as XML. \*file\* is a file name, or a :term:`file object` opened for writing. \*encoding\* [1]\_ is the output encoding (default is US-ASCII).

\*xml\_declaration\* controls if an XML declaration should be added to the file. Use ``False`` for never, ``True`` for always, ``None`` for only if not US-ASCII or UTF-8 or Unicode (default is ``None``). \*default\_namespace\* sets the default XML namespace (for "xmlns"). \*method\* is either ``"xml"``, ``"html"`` or ``"text"`` (default is ``"xml"``).

The keyword-only \*short\_empty\_elements\* parameter controls the formatting of elements that contain no content. If ``True`` (the default), they are emitted as a single self-closed tag, otherwise they are emitted as a pair of start/end tags.

The output is either a string (:class:`str`) or binary (:class:`bytes`). This is controlled by the \*encoding\* argument. If \*encoding\* is ``"unicode"`` , the output is a string; otherwise, it's binary. Note that this may conflict with the type of \*file\* if it's an open :term:`file object`; make sure you do not try to write a string to a binary stream and vice versa.

```
.. versionadded:: 3.4
   The *short_empty_elements* parameter.

.. versionchanged:: 3.8
   The :meth:`write` method now preserves the attribute order specified
   by the user.
```

This is the XML file that is going to be manipulated:

```
<html>
  <head>
    <title>Example page</title>
  </head>
  <body>
    <p>Moved to <a href="http://example.org/">example.org</a>
    or <a href="http://example.com/">example.com</a>.</p>
  </body>
</html>
```

Example of changing the attribute "target" of every link in first paragraph:

```
>>> from xml.etree.ElementTree import ElementTree
>>> tree = ElementTree()
>>> tree.parse("index.xhtml")
<Element 'html' at 0xb77e6fac>
>>> p = tree.find("body/p")      # Finds first occurrence of tag p in body
>>> p
<Element 'p' at 0xb77ec26c>
>>> links = list(p.iter("a"))    # Returns list of all links
>>> links
[<Element 'a' at 0xb77ec2ac>, <Element 'a' at 0xb77ec1cc>]
>>> for i in links:              # Iterates through all found links
...     i.attrib["target"] = "blank"
>>> tree.write("output.xhtml")
```

## QName Objects

QName wrapper. This can be used to wrap a QName attribute value, in order to get proper namespace handling on output. *text\_or\_uri* is a string containing the QName value, in the form {uri}local, or, if the tag argument is given, the URI part of a QName. If *tag* is given, the first argument is interpreted as a URI, and this argument is interpreted as a local name. `.class:QName` instances are opaque.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1223); [backlink](#)**

Unknown interpreted text role "class".

## TreeBuilder Objects

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1238)**

Invalid class attribute value for "class" directive: "TreeBuilder(element\_factory=None, \*, comment\_factory=None, \n pi\_factory=None, insert\_comments=False, insert\_pis=False)".

```
.. class:: TreeBuilder(element_factory=None, *, comment_factory=None, \
                        pi_factory=None, insert_comments=False, insert_pis=False)
```

Generic element structure builder. This builder converts a sequence of start, data, end, comment and pi method calls to a well-formed element structure. You can use this class to build an element structure using a custom XML parser, or a parser for some other XML-like format.

*\*element\_factory\**, when given, must be a callable accepting two positional arguments: a tag and a dict of attributes. It is expected to return a new element instance.

The *\*comment\_factory\** and *\*pi\_factory\** functions, when given, should behave like the `:func:`Comment`` and `:func:`ProcessingInstruction`` functions to create comments and processing instructions. When not given, the default factories will be used. When *\*insert\_comments\** and/or *\*insert\_pis\** is true, comments/pis will be inserted into the tree if they appear within the root element (but not outside of it).

```
.. method:: close()
```

Flushes the builder buffers, and returns the toplevel document element. Returns an :class:`Element` instance.

.. method:: data(data)

Adds text to the current element. \*data\* is a string. This should be either a bytestring, or a Unicode string.

.. method:: end(tag)

Closes the current element. \*tag\* is the element name. Returns the closed element.

.. method:: start(tag, attrs)

Opens a new element. \*tag\* is the element name. \*attrs\* is a dictionary containing element attributes. Returns the opened element.

.. method:: comment(text)

Creates a comment with the given \*text\*. If ``insert\_comments`` is true, this will also add it to the tree.

.. versionadded:: 3.8

.. method:: pi(target, text)

Creates a comment with the given \*target\* name and \*text\*. If ``insert\_pis`` is true, this will also add it to the tree.

.. versionadded:: 3.8

In addition, a custom :class:`TreeBuilder` object can provide the following methods:

.. method:: doctype(name, pubid, system)

Handles a doctype declaration. \*name\* is the doctype name. \*pubid\* is the public identifier. \*system\* is the system identifier. This method does not exist on the default :class:`TreeBuilder` class.

.. versionadded:: 3.2

.. method:: start\_ns(prefix, uri)

Is called whenever the parser encounters a new namespace declaration, before the ``start()`` callback for the opening element that defines it. \*prefix\* is ``''`` for the default namespace and the declared namespace prefix name otherwise. \*uri\* is the namespace URI.

.. versionadded:: 3.8

.. method:: end\_ns(prefix)

Is called after the ``end()`` callback of an element that declared a namespace prefix mapping, with the name of the \*prefix\* that went out of scope.

.. versionadded:: 3.8

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1326)**

Invalid class attribute value for "class" directive: "C14NWriterTarget(write, \*, \ with\_comments=False, strip\_text=False, rewrite\_prefixes=False, \ qname\_aware\_tags=None, qname\_aware\_attrs=None, \ exclude\_attrs=None, exclude\_tags=None)".

```
.. class:: C14NWriterTarget(write, *, \
    with_comments=False, strip_text=False, rewrite_prefixes=False, \
    qname_aware_tags=None, qname_aware_attrs=None, \
    exclude_attrs=None, exclude_tags=None)
```

```
A `C14N 2.0 <https://www.w3.org/TR/xml-c14n2/>`_ writer. Arguments are the
same as for the :func:`canonicalize` function. This class does not build a
tree but translates the callback events directly into a serialised form
using the *write* function.
```

```
.. versionadded:: 3.8
```

## XMLParser Objects

This class is the low-level building block of the module. It uses `mod:`xml.parsers.expat`` for efficient, event-based parsing of XML. It can be fed XML data incrementally with the `meth:`feed`` method, and parsing events are translated to a push API - by invoking callbacks on the *target* object. If *target* is omitted, the standard `class:`TreeBuilder`` is used. If *encoding* [1] is given, the value overrides the encoding specified in the XML file.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1347); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1347); [backlink](#)**

Unknown interpreted text role "meth".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1347); [backlink](#)**

Unknown interpreted text role "class".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1355)**

Unknown directive type "versionchanged".

```
.. versionchanged:: 3.8
   Parameters are now :ref:`keyword-only <keyword-only_parameter>`.
   The *html* argument no longer supported.
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1360)**

Unknown directive type "method".

```
.. method:: close()
```

Finishes feeding data to the parser. Returns the result of calling the `close()` method of the *\*target\** passed during construction; by default, this is the toplevel document element.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1367)**

Unknown directive type "method".

```
.. method:: feed(data)
```

Feeds data to the parser. *\*data\** is encoded data.

`meth:`XMLParser.feed`` calls *target*'s `start(tag, attrs_dict)` method for each opening tag, its `end(tag)` method for each closing tag, and data is processed by `method data(data)`. For further supported callback methods, see the `class:`TreeBuilder`` class. `meth:`XMLParser.close`` calls *target*'s `method close()`. `class:`XMLParser`` can be used not only for building a tree structure. This is an example of counting the maximum depth of an XML file:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1371); [backlink](#)**

Unknown interpreted text role "class".

```
>>> from xml.etree.ElementTree import XMLParser
>>> class MaxDepth:                                # The target object of the parser
...     maxDepth = 0
...     depth = 0
...     def start(self, tag, attrib):              # Called for each opening tag.
...         self.depth += 1
...         if self.depth > self.maxDepth:
...             self.maxDepth = self.depth
...     def end(self, tag):                          # Called for each closing tag.
...         self.depth -= 1
...     def data(self, data):
...         pass                                     # We do not need to do anything with data.
...     def close(self):                             # Called when all data has been parsed.
...         return self.maxDepth
...
>>> target = MaxDepth()
>>> parser = XMLParser(target=target)
>>> exampleXml = """
... <a>
...   <b>
...   </b>
...   <b>
...     <c>
...     <d>
...     </d>
...     </c>
...   </b>
... </a>"""
>>> parser.feed(exampleXml)
>>> parser.close()
4
```

## XMLPullParser Objects

A pull parser suitable for non-blocking applications. Its input-side API is similar to that of `:class:`XMLParser``, but instead of pushing calls to a callback target, `:class:`XMLPullParser`` collects an internal list of parsing events and lets the user read from it. *events* is a sequence of events to report back. The supported events are the strings "start", "end", "comment", "pi", "start-ns" and "end-ns" (the "ns" events are used to get detailed namespace information). If *events* is omitted, only "end" events are reported.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1419); [backlink](#)**

Unknown interpreted text role "class".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1419); [backlink](#)**

Unknown interpreted text role "class".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1428)**

Unknown directive type "method".

```
.. method:: feed(data)
```

Feed the given bytes data to the parser.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1432)**

Unknown directive type "method".

```
.. method:: close()
```

Signal the parser that the data stream is terminated. Unlike :meth:`XMLParser.close`, this method always returns :const:`None`. Any events not yet retrieved when the parser is closed can still be read with :meth:`read\_events`.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1439)**

Unknown directive type "method".

```
.. method:: read_events()
```

Return an iterator over the events which have been encountered in the data fed to the parser. The iterator yields ``(event, elem)`` pairs, where \*event\* is a string representing the type of event (e.g. ``"end"``) and \*elem\* is the encountered :class:`Element` object, or other context value as follows.

- \* ``start``, ``end``: the current Element.
- \* ``comment``, ``pi``: the current comment / processing instruction
- \* ``start-ns``: a tuple ``(prefix, uri)`` naming the declared namespace mapping.
- \* ``end-ns``: :const:`None` (this may change in a future version)

Events provided in a previous call to :meth:`read\_events` will not be yielded again. Events are consumed from the internal queue only when they are retrieved from the iterator, so multiple readers iterating in parallel over iterators obtained from :meth:`read\_events` will have unpredictable results.

## Note

:class:`XMLPullParser` only guarantees that it has seen the ">" character of a starting tag when it emits a "start" event, so the attributes are defined, but the contents of the text and tail attributes are undefined at that point. The same applies to the element children; they may or may not be present.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1461); [backlink](#)**

Unknown interpreted text role "class".

If you need a fully populated element, look for "end" events instead.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1469)**

Unknown directive type "versionadded".

```
.. versionadded:: 3.4
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1471)**

Unknown directive type "versionchanged".

```
.. versionchanged:: 3.8
```

The ``comment`` and ``pi`` events were added.

## Exceptions

XML parse error, raised by the various parsing methods in this module when parsing fails. The string representation of an instance of this exception will contain a user-friendly error message. In addition, it will have the following attributes available:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1485)**

Unknown directive type "attribute".

.. attribute:: code

A numeric error code from the expat parser. See the documentation of :mod:`xml.parsers.expat` for the list of error codes and their meanings.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\library\[cpython-main] [Doc] [library]xml.etree.elementtree.rst, line 1490)**

Unknown directive type "attribute".

.. attribute:: position

A tuple of \*line\*, \*column\* numbers, specifying where the error occurred.

## Footnotes

- [1] The encoding string included in XML output should conform to the appropriate standards. For example, "UTF-8" is valid, but "UTF8" is not. See <https://www.w3.org/TR/2006/REC-xml11-20060816/#NT-EncodingDecl> and <https://www.iana.org/assignments/character-sets/character-sets.xhtml>.
