

Workqueue Example

This example demonstrates how to write a controller which follows the states of watched resources.

It demonstrates how to:

- combine the workqueue with a cache to a full controller
- synchronize the controller on startup

The example is based on <https://git.k8s.io/community/contributors/devel/sig-api-machinery/controllers.md>.

Running

```
# if outside of the cluster
go run *.go -kubeconfig=/my/config
```
