

Visually hide an element while still allowing it to be exposed to assistive technologies (such as screen readers) with `.visually-hidden`. Use `.visually-hidden-focusable` to visually hide an element by default, but to display it when it's focused (e.g. by a keyboard-only user). `.visually-hidden-focusable` can also be applied to a container—thanks to `:focus-within`, the container will be displayed when any child element of the container receives focus.

```
{{< example >}}
```

## Title for screen readers

[Skip to main content](#)

A container with a [focusable element](#).

```
{{< /example >}}
```

Both `visually-hidden` and `visually-hidden-focusable` can also be used as mixins.

```
// Usage as a mixin

.visually-hidden-title {
  @include visually-hidden;
}

.skip-navigation {
  @include visually-hidden-focusable;
}
```
