

Every block-level element has `clientWidth`, `clientHeight`, `offsetWidth` and `offsetHeight` bindings:

```
<div bind:clientWidth={w} bind:clientHeight={h}>
  <span style="font-size: {size}px">{text}</span>
</div>
```

These bindings are readonly — changing the values of `w` and `h` won't have any effect.

*Elements are measured using a technique similar to [this one](#). There is some overhead involved, so it's not recommended to use this for large numbers of elements.*

*`display: inline` elements cannot be measured with this approach; nor can elements that can't contain other elements (such as `<canvas>`). In these cases you will need to measure a wrapper element instead.*
