

The `plugin` attribute was malformed.

Erroneous code example:

```
#![feature(plugin)]
#![plugin(foo(args))] // error: invalid argument
#![plugin(bar="test")] // error: invalid argument
```

The `#[plugin]` attribute should take a single argument: the name of the plugin.

For example, for the plugin `foo`:

```
ignore (requires external plugin crate) #[feature(plugin)]
#![plugin(foo)] // ok!
```

See the `plugin` feature section of the Unstable book for more details.
