

Postgres plugin

This plugin adds some aliases for useful Postgres commands.

:warning: this plugin works exclusively with Postgres installed via Homebrew on OSX because Postgres paths are hardcoded to `/usr/local/var/postgres` .

To use it, add `postgres` to the plugins array in your zshrc file:

```
plugins=(... postgres)
```

Aliases

Alias	Command	Description
startpost	<code>pg_ctl -D /usr/local/var/postgres -l /usr/local/var/postgres/server.log start</code>	Start postgres server
stoppost	<code>pg_ctl -D /usr/local/var/postgres stop -s -m fast</code>	Stop postgres server
restartpost	<code>stoppost && sleep 1 && startpost</code>	Restart (calls stop, then start)
reloadpost	<code>pg_ctl reload -D /usr/local/var/postgres -s</code>	Reload postgres configuration (some setting require restart)
statuspost	<code>pg_ctl status -D /usr/local/var/postgres -s</code>	Check startus of postgres server (running, stopped)
