

Must not access `ServerResponse` after `getServerSideProps()` resolves

Why This Error Occurred `getServerSideProps()` surfaces a `ServerResponse` object through the `res` property of its `context` arg. This object is not intended to be accessed or changed after `getServerSideProps()` resolves.

This is because the framework tries to optimize when items like headers or status codes are flushed to the browser. If they are changed after `getServerSideProps()` completes, we can't guarantee that the changes will work.

For this reason, accessing the object after this time is disallowed.

Possible Ways to Fix It You can fix this error by moving any access of the `res` object into `getServerSideProps()` itself or any functions that run before `getServerSideProps()` returns.

If you're using a custom server and running into this problem due to session middleware like `next-session` or `express-session`, try installing the middleware in the server instead of `getServerSideProps()`.
