

Default

Custom `<select>` menus need only a custom class, `.form-select` to trigger the custom styles. Custom styles are limited to the `<select>` 's initial appearance and cannot modify the `<option>` s due to browser limitations.

```
{{< example >}} Open this select menu ▼ {{< /example >}}
```

Sizing

You may also choose from small and large custom selects to match our similarly sized text inputs.

```
{{< example >}} Open this select menu ▼ {{< /example >}}
```

```
Open this select menu ▼ {{< /example >}}
```

The `multiple` attribute is also supported:

```
{{< example >}} Open this select menu
One
Two
Three {{< /example >}}
```

As is the `size` attribute:

```
{{< example >}} Open this select menu
One
Two {{< /example >}}
```

Disabled

Add the `disabled` boolean attribute on a select to give it a grayed out appearance and remove pointer events.

```
{{< example >}} Open this select menu ▼ {{< /example >}}
```

Sass

Variables

```
{{< scss-docs name="form-select-variables" file="scss/_variables.scss" >}}
```
