

A tuple struct or tuple variant was used in a pattern as if it were a struct or struct variant.

Erroneous code example:

```
enum E {  
    A(i32),  
}  
  
let e = E::A(42);  
  
match e {  
    E::A { number } => { // error!  
        println!("{}", number);  
    }  
}
```

To fix this error, you can use the tuple pattern:

```
# enum E {  
#     A(i32),  
# }  
# let e = E::A(42);  
match e {  
    E::A(number) => { // ok!  
        println!("{}", number);  
    }  
}
```

Alternatively, you can also use the struct pattern by using the correct field names and binding them to new identifiers:

```
# enum E {  
#     A(i32),  
# }  
# let e = E::A(42);  
match e {  
    E::A { 0: number } => { // ok!  
        println!("{}", number);  
    }  
}
```
