

Implements Angular's custom-element API, which enables you to package components as custom elements.

A custom element extends HTML by allowing you to define a tag whose content is created and controlled by JavaScript code. The browser maintains a **CustomElementRegistry** of defined custom elements (also called Web Components), which maps an instantiable JavaScript class to an HTML tag.

The **createCustomElement()** function provides a bridge from Angular's component interface and change detection functionality to the built-in DOM API.

For more information, see [Angular Elements Overview](#).
