

Stretched link

Add `.stretched-link` to a link to make its containing block clickable via a `::after` pseudo element. In most cases, this means that an element with `position: relative`; that contains a link with the `.stretched-link` class is clickable. Please note given how CSS `position` works, `.stretched-link` cannot be mixed with most table elements.

Cards have `position: relative` by default in Bootstrap, so in this case you can safely add the `.stretched-link` class to a link in the card without any other HTML changes.

Multiple links and tap targets are not recommended with stretched links. However, some `position` and `z-index` styles can help should this be required.

```
{{< example >}}
```

```
{{< placeholder width="100%" height="180" class="card-img-top" text="false"
title="Card image cap" >}}
```

```
<h5 class="card-title">Card with stretched link</h5>
```

```
<p class="card-text">Some quick example text to build on the card title and make up the bulk of the content.</p>
```

```
<a href="#" class="btn btn-primary stretched-link">Go somewhere</a>
```

```
{{< /example >}}
```

Most custom components do not have `position: relative` by default, so we need to add the `.position-relative` here to prevent the link from stretching outside the parent element.

```
{{< example >}}
```

```
{{< placeholder width="144" height="144" class="flex-shrink-0 me-3"
text="false" title="Generic placeholder image" >}}
```

```
<h5 class="mt-0">Custom component with stretched link</h5>
```

```
<p>This is some placeholder content for the custom component. It is intended to mimic what Bootstrap's default components look like, but with no real styling.</p>
```

```
<a href="#" class="stretched-link">Go somewhere</a>
```

```
{{< /example >}}
```

```
{{< example >}}
```

```
{{< placeholder width="100%" height="200" class="w-100" text="false" title="Generic placeholder image" >}}
```

```

<h5 class="mt-0">Columns with stretched link</h5>
<p>Another instance of placeholder content for this other custom component. It is intended t
<a href="#" class="stretched-link">Go somewhere</a>

{{< /example >}}

```

Identifying the containing block

If the stretched link doesn't seem to work, the containing block will probably be the cause. The following CSS properties will make an element the containing block:

- A **position** value other than **static**
- A **transform** or **perspective** value other than **none**
- A **will-change** value of **transform** or **perspective**
- A **filter** value other than **none** or a **will-change** value of **filter** (only works on Firefox)

```

{{< example >}}

```

```

{{< placeholder width="100%" height="180" class="card-img-top" text="false"
title="Card image cap" >}}

```

```

<h5 class="card-title">Card with stretched links</h5>
<p class="card-text">Some quick example text to build on the card title and make up the bulk of the
<p class="card-text">
  <a href="#" class="stretched-link text-danger" style="position: relative;">Stretched link
</p>
<p class="card-text bg-light" style="transform: rotate(0);">
  This <a href="#" class="text-warning stretched-link">stretched link</a> will only be spread
</p>

{{< /example >}}

```
