

Docker plugin

This plugin adds auto-completion for [docker](#).

To use it add `docker` to the plugins array in your zshrc file.

```
plugins=(... docker)
```

A copy of the completion script from the docker/cli git repo:

https://github.com/docker/cli/blob/master/contrib/completion/zsh/_docker

Settings

By default, the completion doesn't allow option-stacking, meaning if you try to complete `docker run -it` `<TAB>` it won't work, because you're *stacking* the `-i` and `-t` options.

[You can enable it](#) by **adding the lines below to your zshrc file**, but be aware of the side effects:

This enables Zsh to understand commands like `docker run -it ubuntu`. However, by enabling this, this also makes Zsh complete `docker run -u<tab>` with `docker run -uapprox` which is not valid. The users have to put the space or the equal sign themselves before trying to complete.

Therefore, this behavior is disabled by default. To enable it:

```
zstyle ':completion:*:*:docker:*' option-stacking yes
zstyle ':completion:*:*:docker-*:*' option-stacking yes
```
