

Conflicting representation hints have been used on a same item.

Erroneous code example:

```
#[repr(u32, u64)]  
enum Repr { A }
```

In most cases (if not all), using just one representation hint is more than enough. If you want to have a representation hint depending on the current architecture, use `cfg_attr`. Example:

```
#[cfg_attr(linux, repr(u32))]  
#[cfg_attr(not(linux), repr(u64))]  
enum Repr { A }
```
