

## brew plugin

The plugin adds several aliases for common brew commands.

To use it, add `brew` to the `plugins` array of your `zshrc` file:

```
plugins=(... brew)
```

### Aliases

Alias	Command	Description
<code>brewp</code>	<code>brew pin</code>	Pin a specified formula so that it's not upgraded.
<code>brews</code>	<code>brew list -1</code>	List installed formulae or the installed files for a given formula.
<code>brewsp</code>	<code>brew list --pinned</code>	List pinned formulae, or show the version of a given formula.
<code>bubo</code>	<code>brew update &amp;&amp; brew outdated</code>	Update Homebrew data, then list outdated formulae and casks.
<code>bubc</code>	<code>brew upgrade &amp;&amp; brew cleanup</code>	Upgrade outdated formulae and casks, then run cleanup.
<code>bubu</code>	<code>bubo &amp;&amp; bubc</code>	Do the last two operations above.
<code>buf</code>	<code>brew upgrade --formula</code>	Upgrade only formulas (not casks).
<code>bcubo</code>	<code>brew update &amp;&amp; brew outdated --cask</code>	Update Homebrew data, then list outdated casks.
<code>bcubc</code>	<code>brew upgrade --cask &amp;&amp; brew cleanup</code>	Update outdated casks, then run cleanup.

### Completion

With the release of Homebrew 1.0, they decided to bundle the `zsh` completion as part of the brew installation, so we no longer ship it with the brew plugin; now it only has brew aliases. If you find that brew completion no longer works, make sure you have your Homebrew installation fully up to date.
