

How they work

- **Gutters are the gaps between column content, created by horizontal `padding`.** We set `padding-right` and `padding-left` on each column, and use negative `margin` to offset that at the start and end of each row to align content.
- **Gutters start at `1.5rem` (`24px`) wide.** This allows us to match our grid to the [padding and margin spacers]({{< docsref "/utilities/spacing" >}}) scale.
- **Gutters can be responsively adjusted.** Use breakpoint-specific gutter classes to modify horizontal gutters, vertical gutters, and all gutters.

Horizontal gutters

`.gx-*` classes can be used to control the horizontal gutter widths. The `.container` or `.container-fluid` parent may need to be adjusted if larger gutters are used too to avoid unwanted overflow, using a matching padding utility. For example, in the following example we've increased the padding with `.px-4` :

{{< example >}}

Custom column padding

Custom column padding

{{< /example >}}

An alternative solution is to add a wrapper around the `.row` with the `.overflow-hidden` class:

{{< example >}}

Custom column padding

Custom column padding

{{< /example >}}

Vertical gutters

`.gy-*` classes can be used to control the vertical gutter widths. Like the horizontal gutters, the vertical gutters can cause some overflow below the `.row` at the end of a page. If this occurs, you add a wrapper around `.row` with the `.overflow-hidden` class:

{{< example >}}

Custom column padding

Custom column padding

Custom column padding

Custom column padding

{{< /example >}}

Horizontal & vertical gutters

`.g-*` classes can be used to control the horizontal gutter widths, for the following example we use a smaller gutter width, so there won't be a need to add the `.overflow-hidden` wrapper class.

{{< example >}}

Custom column padding

Custom column padding

Custom column padding

Custom column padding

```
{{< /example >}}
```

Row columns gutters

Gutter classes can also be added to [row columns]({{< docsref "/layout/grid#row-columns" >}}). In the following example, we use responsive row columns and responsive gutter classes.

```
{{< example >}}
```

Row column

```
{{< /example >}}
```

No gutters

The gutters between columns in our predefined grid classes can be removed with `.g-0`. This removes the negative `margin s` from `.row` and the horizontal `padding` from all immediate children columns.

Need an edge-to-edge design? Drop the parent `.container` or `.container-fluid`.

In practice, here's how it looks. Note you can continue to use this with all other predefined grid classes (including column widths, responsive tiers, reorders, and more).

```
{{< example class="bd-example-row" >}}
```

`.col-sm-6.col-md-8`

`.col-6.col-md-4`

```
{{< /example >}}
```

Change the gutters

Classes are built from the `$gutters` Sass map which is inherited from the `$spacers` Sass map.

```
$grid-gutter-width: 1.5rem;
$gutters: (
  0: 0,
  1: $spacer * .25,
  2: $spacer * .5,
  3: $spacer,
  4: $spacer * 1.5,
  5: $spacer * 3,
);
```
