Changelog since v1.5.7

Other notable changes

- Update dnsmasq to the latest version. (#53149, @bowei)
- On GCP platforms, e2e testing now logs which OS images the cluster was found to have. (#48310, @abgworral)
- Update cluster-proportional-autoscaler, etcd-empty-dir-cleanup, fluentd-gcp, and kube-addon-manager addons with refreshed base images containing fixes for CVE-2015-8271, CVE-2016-7543, CVE-2016-9841, CVE-2016-9843, CVE-2017-1000366, CVE-2017-2616, and CVE-2017-7507. (#48011, @ixdy)
- Bump GLBC version to 0.9.5 - fixes loss of manually modified GCLB health check settings upon upgrade from pre-1.6.4 to either 1.6.4 or 1.6.5. (#47567, @nicksardo)
- Upgrade golang version to 1.7.6 (#46408, @cblecker)

Changelog since v1.5.5

Other notable changes

- kube-up (with gce/gci and gce/coreos providers) now ensures the authentication token file contains correct tokens for the control plane components, even if the file already exists (ensures upgrades and downgrades work successfully) (#43676, @liggitt)
- Patch CVE-2016-8859 in alpine based images: (#42936, @timstclair)
 - * gcr.io/google-containers/cluster-proportional-autoscaler-amd64
 - * gcr.io/google-containers/dnsmasq-metrics-amd64
 - * gcr.io/google-containers/etcd-empty-dir-cleanup
 - * gcr.io/google-containers/kube-addon-manager
 - * gcr.io/google-containers/kube-dnsmasq-amd64
- – Disable thin_ls due to excessive iops (#43113, @dashpole)
 - * · Ignore .mount cgroups, fixing disappearing stats
 - * · Fix wc goroutine leak
 - * · Update aws-sdk-go dependency to 1.6.10
- PodSecurityPolicy authorization is correctly enforced by the PodSecurityPolicy admission plugin. (#43489, @liggitt)

- Bump gcr.io/google_containers/glibc from 0.9.1 to 0.9.2. Release notes: 0.9.2 (#43097, @timstclair)
- Update gcr.io/google-containers/rescheduler to v0.2.2, which uses busybox as a base image instead of ubuntu. (#41911, @ixdy)
- restored normalization of custom `--etcd-prefix` when `--storage-backend` is set to `etcd3` (#42506, @liggitt)

v1.5.5

This release contains a fix for a PodSecurityPolicy vulnerability which allows users to make use of any existing PodSecurityPolicy object, even ones they are not authorized to use.

Other than that, this release contains no other changes from 1.5.4.

The vulnerability is tracked in <http://issue.k8s.io/43459>.

Who is affected?

Only Kubernetes 1.5.0-1.5.4 installations that do all of the following: *

- Enable the PodSecurityPolicy API (which is not enabled by default): *
- `--runtime-config=extensions/v1beta1/podsecuritypolicy=true` * Enable the PodSecurityPolicy admission plugin (which is not enabled by default): *
- `--admission-control=...,PodSecurityPolicy,...` * Use authorization to limit users' ability to use specific PodSecurityPolicy objects

What is the impact?

A user that is authorized to create pods can make use of any existing PodSecurityPolicy, even ones they are not authorized to use.

How can I mitigate this prior to installing 1.5.5?

1. Export existing PodSecurityPolicy objects:
 - `kubectl get podsecuritypolicies -o yaml > psp.yaml`
2. Review and delete any PodSecurityPolicy objects you do not want all pod-creating users to be able to use (NOTE: Privileged users that were making use of those policies will also lose access to those policies). For example:
 - `kubectl delete podsecuritypolicies/my-privileged-policy`
3. After upgrading to 1.5.5, re-create the exported PodSecurityPolicy objects:
 - `kubectl create -f psp.yaml`

Changelog since v1.5.3

Other notable changes

- Fix AWS device allocator to only use valid device names (#41455, @gnufied)

- The kube-apiserver basic audit log can be enabled in GCE by exporting the environment variable `ENABLE_APISERVER_BASIC_AUDIT=true` before running `cluster/kube-up.sh`. This will log to `/var/log/kube-apiserver-audit.log` and use the same `logrotate` settings as `/var/log/kube-apiserver.log`. (#41211, @enisoc)
- list-resources: don't fail if the grep fails to match any resources (#41933, @ixdy)
- Bump GCE ContainerVM to container-vm-v20170214 to address CVE-2016-9962. (#41449, @zmerlynn)

Changelog since v1.5.2

Other notable changes

- We change the default `attach_detach_controller` sync period to 1 minute to reduce the query frequency through cloud provider to check whether volumes are attached or not. (#41363, @jingxu97)
- Added configurable `etcd initial-cluster-state` to kube-up script (#41320, @jszczepkowski)
- If `ExperimentalCriticalPodAnnotation=True` flag gate is set, kubelet will ensure that pods with `scheduler.alpha.kubernetes.io/critical-pod` annotation will be admitted even under resource pressure, will not be evicted, and are reasonably protected from system OOMs. (#41052, @vishh)
- Reverts to looking up the current VM in vSphere using the machine's UUID, either obtained via `sysfs` or via the `vm-uuid` parameter in the cloud configuration file. (#40892, @robdaemon)
- Fix for detach volume when node is not present/ powered off (#40118, @BaluDontu)
- Move `b.gcr.io/k8s_authenticated_test` to `gcr.io/k8s-authenticated-test` (#40335, @zmerlynn)
- Bump up GLBC version from 0.9.0-beta to 0.9.1 (#41037, @bprashanth)
- azure: fix Azure Container Registry integration (#40142, @colemickens)

- azure disk: restrict name length for Azure specifications (#40030, @colemickens)
- Bump GCI to gci-beta-56-9000-80-0 (#41027, @dchen1107)
- Bump up glbc version to 0.9.0-beta.1 (#40565, @bprashanth)
- Enable lazy inode table and journal initialization for ext3 and ext4 (#38865, @codablock)
- Kubelet will no longer set hairpin mode on every interface on the machine when an error occurs in setting up hairpin for a specific interface. (#36990, @bboreham)
- The SubjectAccessReview API passes subresource and resource name information to the authorizer to answer authorization queries. (#40935, @liggitt)
- Bump GCE ContainerVM to container-vm-v20170201 to address CVE-2016-9962. (#40828, @zmerlynn)
- Reduce time needed to attach Azure disks (#40066, @codablock)
- Fixes request header authenticator by presenting the request header client CA so that the front proxy will authenticate using its client certificate. (#40301, @deads2k)
- Fix failing load balancers in Azure (#40405, @codablock)
- Add a KUBERNETES_NODE_* section to build kubelet/kube-proxy for windows (#38919, @brendandburns)
- Update GCE ContainerVM deployment to container-vm-v20170117 to pick up CVE fixes in base image. (#40094, @zmerlynn)
- Adding vmdk file extension for vmDiskPath in vsphere DeleteVolume (#40538, @divyenpatel)
- AWS: Remove duplicate calls to DescribeInstance during volume operations (#39842, @gnufied)
- Caching added to the OIDC client auth plugin to fix races and reduce the time kubectrl commands using this plugin take by several seconds. (#38167, @ericchiang)
- Actually fix local-cluster-up on 1.5 branch (#40501, @lavalamp)
- Prevent hotloops on error conditions, which could fill up the disk faster than log rotation can free space. (#40497, @lavalamp)
- Fix issue with PodDisruptionBudgets in which minAvailable specified as a percentage did not work with StatefulSet Pods. (#39454, @foxish)
- Fix panic in vSphere cloud provider (#38423, @BaluDontu)
- Allow missing keys in templates by default (#39486, @ncdc)
- Fix kubectrl get -f -o so it prints all items in the file (#39038, @ncdc)
- Endpoints, that tolerate unready Pods, are now listing Pods in state Terminating as well (#37093, @simonswine)
- Add path exist check in getPodVolumePathListFromDisk (#38909, @jingxu97)
- Ensure the GCI metadata files do not have newline at the end (#38727, @Amey-D)
- AWS: recognize eu-west-2 region (#38746, @justinsb)
- Fix space issue in volumePath with vSphere Cloud Provider (#38338,

- @BaluDontu)
- Fix issue when attempting to unmount a wrong vSphere volume (#37413, @BaluDontu)
- Changed default scsi controller type in vSphere Cloud Provider (#38426, @abrarshivani)
- Fixes API compatibility issue with empty lists incorrectly returning a null `items` field instead of an empty array. (#39834, @liggitt)
- AWS: Add sequential allocator for device names. (#38818, @jsafrane)
- Fix fsGroup to vSphere (#38655, @abrarshivani)

Changelog since v1.5.1

Other notable changes

- Fixes NotAuthenticated errors that appear in the kubelet and kube-controller-manager due to never logging in to vSphere (#36169, @robdaemon)
- Update amd64 kube-proxy base image to debian-iptables-amd64:v5 (#39725, @ixdy)
- Update kube-proxy image to be based off of Debian 8.6 base image. (#39695, @ixdy)
- Fixes an HPA-related panic due to division-by-zero. (#39694, @DirectXMan12)
- Update fluentd-gcp addon to 1.28.1 (#39706, @ixdy)
- Provide kubernetes-controller-manager flags to control volume attach/detach reconciler sync. The duration of the syncs can be controlled, and the syncs can be shut off as well. (#39551, @chrislovecnm)
- AWS: Recognize ca-central-1 region (#38410, @justinsb)
- fix nil dereference when doing a volume type check on persistent volumes (#39529, @sjenning)
- Generate OpenAPI definition for inlined types (#39466, @mbohlool)
- Admit critical pods in the kubelet (#38836, @bprashanth)
- assign -998 as the oom_score_adj for critical pods (e.g. kube-proxy) (#39114, @dchen1107)
- Don't evict static pods (#39059, @bprashanth)
- Fix an issue where AWS tear-down leaks an DHCP Option Set. (#38645, @zmerlynn)
- Give apply the versioned struct that generated from the type defined in the restmapping. (#38982, @ymqytw)
- Add support for Azure Container Registry, update Azure dependencies (#37783, @brendandburns)
- Fixes an issue where `hack/local-up-cluster.sh` would fail on the API server start with (#38898, @deads2k)
 - !!! [1215 15:42:56] Timed out waiting for apiserver: to answer at https://localhost:6443/version; tried 10 waiting 1 between each
- Since `kubernetes.tar.gz` no longer includes client or server binaries, `cluster/kube-{up,down,push}.sh` now automatically download released

binaries if they are missing. (#38730, @ixdy)

- Fixed validation of multizone cluster for GCE (#38695, @jszczepkowski)
- Fix nil pointer dereference in test framework (#37583, @mtaufen)
- Fixed detection of master during creation of multizone nodes cluster by kube-up. (#38617, @jszczepkowski)
- Kubelet: Add image cache. (#38375, @Random-Liu)

Changelog since v1.5.0

Other notable changes

- Changes the default value of the “anonymous-auth” flag to a safer default value of false. This affects kube apiserver and federation apiserver. See <https://groups.google.com/forum/#!topic/kubernetes-announce/iclRj-6Nfsg> for more details. (#38708, @erictune)
- Fixes issue where if the audit log is enabled and anonymous authentication is disabled, then an unauthenticated user request will cause a panic and crash the `kube-apiserver`. (#38717, @deads2k)

Known Issues for v1.5.1

- `hack/local-up-cluster.sh` script times out waiting for apiserver to answer, see #38847. To workaround this, modify the script to pass `--anonymous-auth=true` to `sudo -E "${GO_OUT}/hyperkube" apiserver ...` when starting kube-apiserver.

Major Themes

- StatefulSets (ex-PetSets)
 - StatefulSets are beta now (fixes and stabilization)
- Improved Federation Support
 - New command: **kubefed**
 - DaemonSets
 - Deployments
 - ConfigMaps
- Simplified Cluster Deployment
 - Improvements to **kubeadm**
 - HA Setup for Master
- Node Robustness and Extensibility
 - Windows Server Container support
 - CRI for pluggable container runtimes
 - **kubelet** API supports authentication and authorization

Features

Features for this release were tracked via the use of the [kubernetes/features](#) issues repo. Each Feature issue is owned by a Special Interest Group from [kubernetes/community](#)

- **API Machinery**
 - [beta] `kube-apiserver` support for the OpenAPI spec is moving from alpha to beta. The first non-go client is based on it ([kubernetes/features#53](#))
- **Apps**
 - [stable] When replica sets cannot create pods, they will now report detail via the API about the underlying reason ([kubernetes/features#120](#))
 - [stable] `kubectl apply` is now able to delete resources you no longer need with `--prune` ([kubernetes/features#128](#))
 - [beta] Deployments that cannot make progress in rolling out the newest version will now indicate via the API they are blocked ([docs](#)) ([kubernetes/features#122](#))
 - [beta] StatefulSets allow workloads that require persistent identity or per-instance storage to be created and managed on Kubernetes. ([docs](#)) ([kubernetes/features#137](#))
 - [beta] In order to preserve safety guarantees the cluster no longer force deletes pods on un-responsive nodes and users are now warned if they try to force delete pods via the CLI. ([docs](#)) ([kubernetes/features#119](#))
- **Auth**
 - [alpha] Further polishing of the Role-based access control alpha API including a default set of cluster roles. ([docs](#)) ([kubernetes/features#2](#))
 - [beta] Added ability to authenticate/authorize access to the Kubelet API ([docs](#)) ([kubernetes/features#89](#))
- **AWS**
 - [stable] Roles should appear in `kubectl get nodes` ([kubernetes/features#113](#))
- **Cluster Lifecycle**
 - [alpha] Improved UX and usability for the `kubeadm` binary that makes it easy to get a new cluster running. ([docs](#)) ([changelog](#)) ([kubernetes/features#11](#))
- **Cluster Ops**
 - [alpha] Added ability to create/remove clusters w/highly available (replicated) masters on GCE using `kube-up/kube-down` scripts. ([docs](#)) ([kubernetes/features#48](#))
- **Federation**
 - [alpha] Support for ConfigMaps in federation. ([docs](#)) ([kubernetes/features#105](#))
 - [alpha] Alpha level support for DaemonSets in federation. ([docs](#)) ([kubernetes/features#101](#))

- [alpha] Alpha level support for Deployments in federation. (docs) (kubernetes/features#100)
- [alpha] Cluster federation: Added support for DeleteOptions.OrphanDependents for federation resources. (docs) (kubernetes/features#99)
- [alpha] Introducing **kubefed**, a new command line tool to simplify federation control plane. (docs) (kubernetes/features#97)
- **Network**
 - [stable] Services can reference another service by DNS name, rather than being hosted in pods (kubernetes/features#33)
 - [beta] Opt in source ip preservation for Services with Type NodePort or LoadBalancer (docs) (kubernetes/features#27)
 - [stable] Enable DNS Horizontal Autoscaling with beta ConfigMap parameters support (docs)
- **Node**
 - [alpha] Added ability to preserve access to host users when users remapping is enabled in container runtime (kubernetes/features#127)
 - [alpha] Introducing the v1alpha1 CRI API to allow pluggable container runtimes; an experimental docker-CRI integration is ready for testing and feedback. (docs) (kubernetes/features#54)
 - [alpha] Kubelet launches container in a per pod cgroup hierarchy based on quality of service tier (kubernetes/features#126)
 - [beta] Kubelet integrates with memcg notification API to detect when a hard eviction threshold is crossed (kubernetes/features#125)
 - [beta] Introducing the beta version containerized node conformance test `gcr.io/google_containers/node-test:0.2` for users to verify node setup. (docs) (kubernetes/features#84)
- **Scheduling**
 - [alpha] Added support for accounting opaque integer resources. (docs) (kubernetes/features#76)
 - [beta] PodDisruptionBudget has been promoted to beta, can be used to safely drain nodes while respecting application SLO's (docs) (kubernetes/features#85)
- **UI**
 - [stable] Dashboard UI now shows all user facing objects and their resource usage. (docs) (kubernetes/features#136)
- **Windows**
 - [alpha] Added support for Windows Server 2016 nodes and scheduling Windows Server Containers (docs) (kubernetes/features#116)

Known Issues

Populated via v1.5.0 known issues / FAQ accumulator

- CRI known issues and limitations
- `getDeviceNameFromMount()` function doesn't return the volume path

correctly when the volume path contains spaces #37712

- Federation alpha features do not have feature gates defined and are hence enabled by default. This will be fixed in a future release. #38593
- Federation control plane can be upgraded by updating the image fields in the **Deployment** specs of the control plane components. However, federation control plane upgrades were not tested in this release 38537

Notable Changes to Existing Behavior

- Node controller no longer force-deletes pods from the api-server. (#35235, @foxish)
 - For StatefulSet (previously PetSet), this change means creation of replacement pods is blocked until old pods are definitely not running (indicated either by the kubelet returning from partitioned state, deletion of the Node object, deletion of the instance in the cloud provider, or force deletion of the pod from the api-server). This helps prevent “split brain” scenarios in clustered applications by ensuring that unreachable pods will not be presumed dead unless some “fencing” operation has provided one of the above indications.
 - For all other existing controllers except StatefulSet, this has no effect on the ability of the controller to replace pods because the controllers do not reuse pod names (they use generate-name).
 - User-written controllers that reuse names of pod objects should evaluate this change.
 - When deleting an object with `kubectl delete ... --grace-period=0`, the client will begin a graceful deletion and wait until the resource is fully deleted. To force deletion immediately, use the `--force` flag. This prevents users from accidentally allowing two Stateful Set pods to share the same persistent volume which could lead to data corruption #37263
- Allow anonymous API server access, decorate authenticated users with `system:authenticated` group (#32386, @liggitt)
 - kube-apiserver learned the ‘`-anonymous-auth`’ flag, which defaults to true. When enabled, requests to the secure port that are not rejected by other configured authentication methods are treated as anonymous requests, and given a username of ‘`system:anonymous`’ and a group of ‘`system:unauthenticated`’.
 - Authenticated users are decorated with a ‘`system:authenticated`’ group.
 - **IMPORTANT:** See Action Required for important actions related to this change.
- `kubectl get -o jsonpath=...` will now throw an error if the path is to a field not present in the json, even if the path is for a field valid for the type. This is a change from the pre-1.5 behavior, which would return the default

value for some fields even if they were not present in the json. (#37991, @pwittrock)

- The strategicmerge patchMergeKey for VolumeMounts was changed from “name” to “mountPath”. This was necessary because the name field refers to the name of the Volume, and is not a unique key for the VolumeMount. Multiple VolumeMounts will have the same Volume name if mounting the same volume more than once. The “mountPath” is verified to be unique and can act as the mergekey. (#35071, @pwittrock)

Deprecations

- extensions/v1beta1.Jobs is deprecated, use batch/v1.Job instead (#36355, @soltys)
- The kubelet `--reconcile-cdir` flag is deprecated because it has no function anymore. (#35523, @luxas)
- Notice of deprecation for recycler #36760
- The init-container (pod.beta.kubernetes.io/init-containers) annotations used to accept capitalized field names that could be accidentally generated by the k8s.io/kubernetes/pkg/api package. Using an upper case field name will now return an error and all users should use the versioned API types from `pkg/api/v1` when serializing from Golang.

Action Required Before Upgrading

- Important Security-related changes before upgrading
 - You *MUST* set `--anonymous-auth=false` flag on your kube-apiserver unless you are a developer testing this feature and understand it. If you do not, you risk allowing unauthorized users to access your apiserver.
 - You *MUST* set `--anonymous-auth=false` flag on your federation apiserver unless you are a developer testing this feature and understand it. If you do not, you risk allowing unauthorized users to access your federation apiserver.
 - You do not need to adjust this flag on Kubelet: there was no authorization for the Kubelet APIs in 1.4.
- batch/v2alpha1.ScheduledJob has been renamed, use batch/v2alpha1.CronJob instead (#36021, @soltys)
- PetSet has been renamed to StatefulSet. If you have existing PetSets, **you must perform extra migration steps** both before and after upgrading to convert them to StatefulSets. (docs) (#35663, @janetkuo)
- If you are upgrading your Cluster Federation components from v1.4.x, please update your `federation-apiserver` and `federation-controller-manager` manifests to the new version (#30601, @madhusudancs)
- The deprecated kubelet `--configure-cbr0` flag has been removed, and with that the “classic” networking mode as well. If you depend on this mode,

please investigate whether the other network plugins `kubenet` or `cni` meet your needs. (#34906, @luxas)

- New client-go structure, refer to `kubernetes/client-go` for versioning policy (#34989, @caesarxuchao)
- The deprecated `kube-scheduler` `-bind-pods-qps` and `-bind-pods burst` flags have been removed, use `-kube-api-qps` and `-kube-api-burst` instead (#34471, @timothysc)
- If you used the `PodDisruptionBudget` feature in 1.4 (i.e. created `PodDisruptionBudget` objects), then **BEFORE** upgrading from 1.4 to 1.5, you must delete all `PodDisruptionBudget` objects (`policy/v1alpha1/PodDisruptionBudget`) that you have created. It is not possible to delete these objects after you upgrade, and their presence will prevent you from using the beta `PodDisruptionBudget` feature in 1.5 (which uses `policy/v1beta1/PodDisruptionBudget`). If you have already upgraded, you will need to downgrade the master to 1.4 to delete the `policy/v1alpha1/PodDisruptionBudget` objects.

External Dependency Version Information

Continuous integration builds have used the following versions of external dependencies, however, this is not a strong recommendation and users should consult an appropriate installation or upgrade guide before deciding what versions of `etcd`, `docker` or `rkt` to use.

- Docker versions 1.10.3 - 1.12.3
 - Docker version 1.11.2 known issues
 - * Kernel crash with Aufs storage driver on Debian Jessie (#27885 which can be identified by the node problem detector)
 - * Leaked File descriptors (#275)
 - * Additional memory overhead per container (#21737)
 - Docker version 1.12.1 has been validated through the Kubernetes docker automated validation framework as has Docker version 1.12.3
- Docker 1.10.3 contains backports provided by RedHat for known issues
- Docker versions as old as may 1.9.1 work with known issues but this is not guaranteed
- rkt version 1.21.0
 - known issues with the rkt runtime are listed here
- etcd version 2.2.1
 - etcd version 3.0.14 has also been validated but does require specific configuration steps

Changelog since v1.5.0-beta.3

Other notable changes

- Bump GCE debian image to `container-vm-v20161208` (release notes) (#38444, @timstclair)

- Fix unmountDevice issue caused by shared mount in GCI (#38411, @jingxu97)

Previous Releases Included in v1.5.0

- v1.5.0-beta.3
- v1.5.0-beta.2
- v1.5.0-beta.1
- v1.5.0-alpha.2
- v1.5.0-alpha.1

Changelog since v1.5.0-beta.2

Other notable changes

- Better compat with very old iptables (e.g. CentOS 6) (#37594, @thockin)
- fix permissions when using fsGroup (#37009, @sjenning)
- Fix GCI mounter issue (#38124, @jingxu97)
- fix mesos unit tests (#38196, @deads2k)
- Fix Service Update on LoadBalancerSourceRanges Field (#37720, @freehan)
- Fix Service Update on LoadBalancerSourceRanges Field (#37720, @freehan)
- Set kernel.softlockup_panic = 1 based on the flag. (#38001, @dchen1107)
- Fix logic error in graceful deletion (#37721, @derekwaynecarr)
- Enable containerized mounter only for nfs and glusterfs types (#37990, @jingxu97)
- GCI: Remove /var/lib/docker/network (#37593, @yujuhong)
- kubelet: don't reject pods without adding them to the pod manager (#37661, @yujuhong)
- Fix photon controller plugin to construct with correct PodID (#37167, @luomiao)
- Fix the equality checks for numeric values in cluster/gce/util.sh. (#37638, @roberthbailey)
- federation service controller: stop deleting services from underlying clusters when federated service is deleted. (#37353, @nikhiljindal)
- Set Dashboard UI version to v1.5.0 (#37684, @rf232)
- When deleting an object with **--grace-period=0**, the client will begin a graceful deletion and wait until the resource is fully deleted. To force deletion, use the **--force** flag. (#37263, @smarterclayton)
- Removes shorthand flag -w from kubectl apply (#37345, @MrHohn)
- Update doc for kubectl apply (#37397, @ymqytw)
- Try self-repair scheduler cache or panic (#37379, @wojtek-t)
- Use gsed on the Mac (#37562, @roberthbailey)
- Fix TestServiceAlloc flakes (#37487, @wojtek-t)

Changelog since v1.5.0-beta.1

Other notable changes

- Modify GCI mounter to enable NFSv3 (#36610, @jingxu97)
- Third party resources are now deleted when a namespace is deleted. (#35947, @brendandburns)
- kube-dns (#36775, @bowei)
 - Added `-config-map` and `-config-map-namespace` command line options.
 - If `-config-map` is set, kube-dns will load dynamic configuration from the config map referenced by `-config-map-namespace`, `-config-map`. The config-map supports the following properties: “federations”.
 - `-federations` flag is now deprecated. Prefer to set federations via the config-map. Federations can be configured by settings the “federations” field to the value currently set in the command line.
 - Example:

```
yaml      kind: ConfigMap      apiVersion:
v1      metadata:      name: kube-dns      namespace:
kube-system      data:      federations: abc=def
```
- azure: support multiple ipconfigs on a NIC (#36841, @colemickens)
- Fix issue in converting AWS volume ID from mount paths (#36840, @jingxu97)
- fix leaking memory backed volumes of terminated pods (#36779, @sjenning)
- Default logging subsystem’s resiliency was greatly improved, fluentd memory consumption and OOM error probability was reduced. (#37021, @Crassirostris)

Changelog since v1.5.0-alpha.2

Action Required

- Deprecate extensions/v1beta1.Jobs (#36355, @solttysh)
- Rename ScheduledJobs to CronJobs. (#36021, @solttysh)
- Read the federation controller manager kubeconfig from a filesystem path (#30601, @madhusudancs)
- Node controller to not force delete pods (#35235, @foxish)
- Add perma-failed deployments API (#19343, @kargakis)

Other notable changes

- Federation: allow specification of dns zone by ID (#36336, @justinsb)
- K8s 1.5 keeps container-vm as the default node image on GCE for backwards compatibility reasons. Please beware that container-vm is officially deprecated (supported with security patches only) and you should replace it with GCI if at all possible. You can review the migration guide here for more detail: <https://cloud.google.com/container-engine/docs/node-image-migration> (#36822, @mtaufen)

- Add a flag allowing contention profiling of the API server (#36756, @gmarek)
- Rename `--cgroups-per-qos` to `--experimental-cgroups-per-qos` in Kubelet (#36767, @vishh)
- Implement `CanMount()` for `gfsMounter` for linux (#36686, @rkouj)
- Default host user namespace via experimental flag (#31169, @pweil-)
- Use generous limits in the resource usage tracking tests (#36623, @yujuhong)
- Update Dashboard UI version to 1.4.2 (#35895, @rf232)
- Add support for service load balancer source ranges to Azure load balancers. (#36696, @brendandburns)
- gci-dev-56-8977-0-0: (#36681, @mtaufen)
 - Date: Nov 03, 2016
 - Kernel: ChromiumOS-4.4
 - Kubernetes: v1.4.5
 - Docker: v1.11.2
 - Changelog (vs 55-8872-18-0) * Updated kubernetes to v1.4.5 * Fixed a bug in `e2fsprogs` that caused `mke2fs` to take a very long time. Upstream fix: <http://git.kernel.org/cgit/fs/ext2/e2fsprogs.git/commit/?h=next&id=d33e690fe7a6cbeb5>
- Fix strategic patch for list of primitive type with merge semantic (#35647, @ymqytw)
- Fix issue in reconstruct volume data when kubelet restarts (#36616, @jingxu97)
- Ensure proper serialization of updates and creates in federation test watcher (#36613, @mwielgus)
- Add support for SourceIP preservation in Azure LBs (#36557, @brendandburns)
- Fix fetching pids running in a cgroup, which caused problems with OOM score adjustments & setting the `/system` cgroup (“misc” in the summary API). (#36551, @timstclair)
- federation: Adding support for `DeleteOptions.OrphanDependents` for federated replicaset and deployments. Setting it to false while deleting a federated replicaset or deployment also deletes the corresponding resource from all registered clusters. (#36476, @nikhiljindal)
- kubectrl: show node label if defined (#35901, @justinsb)
- Migrates addons from RCs to Deployments (#36008, @MrHohn)
- Avoid setting `S_ISGID` on files in volumes (#36386, @sjenning)
- federation: Adding support for `DeleteOptions.OrphanDependents` for federated daemonsets and ingresses. Setting it to false while deleting a federated daemonset or ingress also deletes the corresponding resource from all registered clusters. (#36330, @nikhiljindal)
- Add authz to psp admission (#33080, @pweil-)
- Better messaging for missing volume binaries on host (#36280, @rkouj)
- Add Windows support to kube-proxy (#36079, @jbhurat)
- Support persistent volume usage for kubernetes running on Photon Controller platform (#36133, @luomiao)

- GCI nodes use an external mounter script to mount NFS & GlusterFS storage volumes (#36267, @vishh)
- Add retry to node scheduability marking. (#36211, @brendandburns)
- specify custom ca file to verify the keystone server (#35488, @dixudx)
- AWS: Support default value for ExternalHost (#33568, @justinsb)
- HPA: Consider unready pods separately (#33593, @DirectXMan12)
- Node Conformance Test: Containerize the node e2e test (#31093, @Random-Liu)
- federation: Adding support for DeleteOptions.OrphanDependents for federated secrets. Setting it to false while deleting a federated secret also deletes the corresponding secrets from all registered clusters. (#36296, @nikhiljindal)
- Deploy kube-dns with cluster-proportional-autoscaler (#33239, @MrHohn)
- Adds support for StatefulSets in kubectl drain. (#35483, @ymqytw)
 - Switches to use the eviction sub-resource instead of deletion in kubectl drain, if server supports.
- azure: load balancer preserves destination ip address (#36256, @colemickens)
- LegacyHostIP will be deprecated in 1.7. (#36095, @caesarxuchao)
- Fix LBaaS version detection in openstack cloudprovider (#36249, @sjenning)
- Node Conformance Test: Add system verification (#32427, @Random-Liu)
- kubelet bootstrap: start hostNetwork pods before we have PodCIDR (#35526, @justinsb)
- Enable HPA controller based on autoscaling/v1 api group (#36215, @piosz)
- Remove unused WaitForDetach from Detacher interface and plugins (#35629, @kiall)
- Initial work on running windows containers on Kubernetes (#31707, @alexbrand)
- Per Volume Inode Accounting (#35132, @dashpole)
- [AppArmor] Hold bad AppArmor pods in pending rather than rejecting (#35342, @timstclair)
- Federation: separate notion of zone-name & dns-suffix (#35372, @justinsb)
- In order to bypass graceful deletion of pods (to immediately remove the pod from the API) the user must now provide the `--force` flag in addition to `--grace-period=0`. This prevents users from accidentally force deleting pods without being aware of the consequences of force deletion. Force deleting pods for resources like StatefulSets can result in multiple pods with the same name having running processes in the cluster, which may lead to data corruption or data inconsistency when using shared storage or common API endpoints. (#35484, @smarterclayton)
- NPD: Add e2e test for NPD v0.2. (#35740, @Random-Liu)
- DELETE requests can now pass in their DeleteOptions as a query parameter or a body parameter, rather than just as a body parameter. (#35806, @bdbauer)
- make using service account credentials from controllers optional (#35970,

@deads2k)

- AWS: strong-typing for k8s vs aws volume ids (#35883, @justinsb)
- Controller changes for perma failed deployments (#35691, @kargakis)
- Proxy min sync period (#35334, @timothyse)
- Federated ConfigMap controller (#35635, @mwielgus)
- have basic kubectl crud agnostic of registered types (#36085, @deads2k)
- Fix how we iterate over active jobs when removing them for Replace policy (#36161, @solysh)
- Adds TCPCloseWaitTimeout option to kube-proxy for sysctl nf_conntrack_tcp_timeout_time_wait (#35919, @bowei)
- Pods that are terminating due to eviction by the nodecontroller (typically due to unresponsive kubelet, or network partition) now surface in `kubectl get` output (#36017, @foxish)
 - as being in state “Unknown”, along with a longer description in `kubectl describe` output.
- The hostname of the node (as autodetected by the kubelet, specified via `--hostname-override`, or determined by the cloudprovider) is now recorded as an address of type “Hostname” in the status of the Node API object. The hostname is expected to be resolveable from the apiserver. (#25532, @mkulke)
- [Kubelet] Add alpha support for `--cgroups-per-qos` using the configured `--cgroup-driver`. Disabled by default. (#31546, @derekwaynecarr)
- Move Statefulset (previously PetSet) to v1beta1 (#35731, @janetkuo)
- The error handling behavior of `pkg/client/restclient.Result` has changed. Calls to `Result.Raw()` will no longer parse the body, although they will still return errors that react to `pkg/api/errors.Is*()` as in previous releases. Callers of `Get()` and `Into()` will continue to receive errors that are parsed from the body if the kind and apiVersion of the body match the `Status` object. (#36001, @smarterclayton)
 - This more closely aligns rest client as a generic RESTful client, while preserving the special Kube API extended error handling for the `Get` and `Into` methods (which most Kube clients use).
- Making the `pod.alpha.kubernetes.io/initialized` annotation optional in PetSet pods (#35739, @foxish)
- AWS: recognize us-east-2 region (#35013, @justinsb)
- Eviction manager evicts based on inode consumption (#35137, @dashpole)
- SELinux Overhaul (#33663, @pmorie)
- Add SNI support to the apiserver (#35109, @sttts)
- The main kubernetes repository stops hosting archived version of released clients. Please use client-go. (#35928, @caesarxuchao)
- Correct the article in generated documents (#32557, @asalkeld)
- Update PodAntiAffinity to ignore calls to subresources (#35608, @solysh)
- The apiserver can now select which type of kubelet-reported address to use for apiserver->node communications, using the `--kubelet-preferred-address-types` flag. (#35497, @liggitt)
- update list of vailable resources (#32687, @jouve)

- Remove stale volumes if endpoint/svc creation fails. (#35285, @humblec)
- add kubectl cp (#34914, @brendandburns)
- Remove Job also from .status.active for Replace strategy (#35420, @soltys)
- Let release_1_5 clientset include multiple versions of a group (#35471, @caesarxuchao)
- support editing before creating resource (#33250, @ymqytw)
- allow authentication through a front-proxy (#35452, @deads2k)
- On GCI, cleanup kubelet startup (#35319, @vishh)
- Add a retry when reading a file content from a container (#35560, @jingxu97)
- Fix cadvisor_unsupported and the crossbuild (#35817, @luxas)
- [PHASE 1] Opaque integer resource accounting. (#31652, @ConnorDoyle)
- Add sync state loop in master's volume reconciler (#34859, @jingxu97)
- Bump GCE debian image to container-vm-v20161025 (CVE-2016-5195 Dirty... (#35825, @dchen1107)
- GC pod ips (#35572, @bprashanth)
- Stop including arch-specific binaries in kubernetes.tar.gz (#35737, @ixdy)
- Rename PetSet to StatefulSet (#35663, @janetkuo)
- Enable containerized storage plugins mounter on GCI (#35350, @vishh)
- Bump container-vm version in config-test.sh (#35705, @mtaufen)
- Cadvisor root path configuration (#35136, @dashpole)
- ssh pubkey parsing: prevent segfault (#35323, @mikkeloscar)

v1.5.0-alpha.2

Changelog since v1.5.0-alpha.1

Action Required

- Deprecate the `--reconcile-cidr` kubelet flag because it has no function anymore (#35523, @luxas)
- Removed the deprecated kubelet `--configure-cbr0` flag, and with that the “classic” networking mode as well (#34906, @luxas)
- New client-go structure (#34989, @caesarxuchao)
- Remove scheduler flags that were marked as deprecated 2+ releases ago. (#34471, @timothysc)

Other notable changes

- Make the fake `RESTClient` usable by all the API groups, not just core. (#35492, @madhusudancs)
- Adding support for `DeleteOptions.OrphanDependents` for federated namespaces. Setting it to false while deleting a federated namespace also deletes the corresponding namespace from all registered clusters. (#34648, @nikhiljindal)
- Kubelet flag `--mounter-path` renamed to `--experimental-mounter-path` (#35646, @vishh)

- Node status updater should SetNodeStatusUpdateNeeded if it fails to update status (#34368, @jingxu97)
- Deprecate OpenAPI spec for GroupVersion endpoints in favor of single spec /swagger.json (#35388, @mbohlool)
- kubelet authn/authz (#34381, @liggitt)
- Fix volume states out of sync problem after kubelet restarts (#33616, @jingxu97)
- Added rkt binary to GCI (#35321, @vishh)
- Fixed mutation warning in Attach/Detach controller (#35273, @jsafrane)
- Don't count failed pods as "not-ready" (#35404, @brendandburns)
- fixed typo in script which made setting custom cidr in gce using kube-up impossible (#35267, @tommywo)
- The podGC controller will now always run, irrespective of the value supplied to the "terminated-pod-gc-threshold" flag supplied to the controller manager. (#35476, @foxish)
 - The specific behavior of the podGC controller to clean up terminated pods is still governed by the flag, but the podGC's responsibilities have evolved beyond just cleaning up terminated pods.
- Update grafana version used by default in kubernetes to 3.1.1 (#35435, @Crassirostris)
- vSphere Kube-up: resolve vm-names on all nodes (#35365, @kerneltime)
- bootstrap: Start hostNetwork pods even if network plugin not ready (#33347, @justinsb)
- Factor out post-init swagger and OpenAPI routes (#32590, @sttts)
- Substitute gcloud regex with regexp (#35346, @bprashanth)
- Remove support for multi-architecture code in **kubeadm**, which was released untested. (#35124, @errordeveloper)
- vSphere kube-up: Wait for cbr0 configuration to complete before setting up routes. (#35232, @kerneltime)
- Remove last probe time from replica sets (#35199, @kargakis)
- Update the GCI image to gci-dev-55-8872-18-0 (#35243, @maisem)
- Add **--mounter-path** flag to kubelet that will allow overriding the **mount** command used by kubelet (#34994, @jingxu97)
- Fix a bug under the rkt runtime whereby image-registries with ports would not be fetched from (#34375, @euank)
- Updated default Elasticsearch and Kibana used for elasticsearch logging destination to versions 2.4.1 and 4.6.1 respectively. (#34969, @Crassirostris)
- Loadbalanced client src ip preservation enters beta (#33957, @bprashanth)
- Add NodePort value in kubectrl output (#34922, @zreigz)
- kubectrl drain now waits until pods have been delete from the Node before exiting (#34778, @ymqytw)
- Don't report FS stats for system containers in the Kubelet Summary API (#34998, @timstclair)
- Fixed flakes caused by petset tests. (#35158, @foxish)
- Add validation that detects repeated keys in the labels and annotations

- maps (#34407, @brendandburns)
- Change merge key for VolumeMount to mountPath (#35071, @thockin)
- kubelet: storage: don't hang kubelet on unresponsive nfs (#35038, @sjenning)
- Fix kube vsphere.kerneltime (#34997, @kerneltime)
- Add PSP support for seccomp profiles (#28300, @pweil-)
- Updated Go to 1.7 (#28742, @jessfraz)
- HPA: fixed wrong count for target replicas calculations (#34821). (#34955, @jszczepkowski)
- Improves how 'kubectl' uses the terminal size when printing help and usage. (#34502, @fabianofranz)
- Updated Elasticsearch image from version 1.5.1 to version 2.4.1. Updated Kibana image from version 4.0.2 to version 4.6.1. (#34562, @Crassirostris)
- libvirt-coreos: Download the coreos_production_qemu_image over SSL. (#34646, @roberthbailey)
- Add a new global option "--request-timeout" to the **kubectl** client (#33958, @juanvallejo)
- Add support for admission controller based on namespace node selectors. (#24980, @aveshagarwal)
- Add 'kubectl set resources' (#27206, @JacobTanenbaum)
- Support trust id as a scope in the OpenStack authentication logic (#32111, @MatMaul)
- Only wait for cache syncs once in NodeController (#34851, @ncdc)
- NodeController waits for informer sync before doing anything (#34809, @gmarek)
- azure: lower log priority for skipped nic update message (#34730, @colemickens)
- Security Group support for OpenStack Load Balancers (#31921, @grahamhayes)
- Make NodeController recognize deletion tombstones (#34786, @davidopp)
- Delete all firewall rules (and optionally network) on GCE/GKE cluster teardown (#34577, @ixdy)
- Fix panic in NodeController caused by receiving DeletedFinalStateUnknown object from the cache. (#34694, @gmarek)
- azure: add PrimaryAvailabilitySet to config, only use nodes in that set in the loadbalancer pool (#34526, @colemickens)
- Fix leaking ingress resources in federated ingress e2e test. (#34652, @quinton-hoole)
- pvc.Spec.Resources.Requests min and max can be enforced with a LimitRange of type "PersistentVolumeClaim" in the namespace (#30145, @markturansky)
- Federated DaemonSet controller. Supports all the API that regular DaemonSet has. (#34319, @mwielgus)
- New federation deployment mechanism now allows non-GCP clusters. (#34620, @madhusudancs)
 - Writes the federation kubeconfig to the local kubeconfig file.

- Update the series and the README to reflect the change. (#30374, @mbuzek)
- Replica set conditions API (#33905, @kargakis)
- etcd3: avoid unnecessary decoding in etcd3 client (#34435, @wojtekt)
- Test x509 intermediates correctly (#34524, @ligitt)
- Add `cifs-utils` to the hyperkube image. (#34416, @colemickens)
- etcd3: use PrevKV to remove additional get (#34246, @hongchaodeng)
- Fix upgrade.sh image setup (#34468, @mtaufen)

v1.5.0-alpha.1

Documentation & Examples

Changelog since v1.4.0-alpha.3

Experimental Features

- `kubeadm` (alpha) provides an easy way to securely bootstrap Kubernetes on Linux, see <http://kubernetes.io/docs/kubeadm/> (#33262, @errordeveloper)
- Alpha JWS Discovery API for locating an apiserver securely (#32203, @dgoodwin)

Action Required

- `kube-apiserver` learned the `'-anonymous-auth'` flag, which defaults to true. When enabled, requests to the secure port that are not rejected by other configured authentication methods are treated as anonymous requests, and given a username of `'system:anonymous'` and a group of `'system:unauthenticated'`. (#32386, @ligitt)
 - Authenticated users are decorated with a `'system:authenticated'` group.
 - NOTE: anonymous access is enabled by default. If you rely on authentication alone to authorize access, change to use an authorization mode other than `AlwaysAllow`, or set `'-anonymous-auth=false'`.
- The `NamespaceExists` and `NamespaceAutoProvision` admission controllers have been removed. (#31250, @derekwaynecarr)
 - All cluster operators should use `NamespaceLifecycle`.

- Federation binaries and their corresponding docker images - **federation-apiserver** and **federation-controller-manager** are now folded in to the **hyperkube** binary. If you were using one of these binaries or docker images, please switch to using the **hyperkube** version. Please refer to the federation manifests - **federation/manifests/federation-apiserver.yaml** and **federation/manifests/federation-controller-manager-deployment.yaml** for examples. (#29929, @madhusudancs)

Other notable changes

- The kube-apiserver `--service-account-key-file` option can be specified multiple times, or can point to a file containing multiple keys, to enable rotation of signing keys. (#34029, @liggitt)
- The apiserver now uses addresses reported by the kubelet in the Node object's status for apiserver->kubelet communications, rather than the name of the Node object. The address type used defaults to **InternalIP**, **ExternalIP**, and **LegacyHostIP** address types, in that order. (#33718, @justinsb)
- Federated deployment controller that supports the same api as the regular kubernetes deployment controller. (#34109, @mwielgus)
- Match GroupVersionKind against specific version (#34010, @soltys)
- fix yaml decode issue (#34297, @AdoHe)
- kubectl annotate now supports `--dry-run` (#34199, @asalkeld)
- kubectl: Add external ip information to node when `'-o wide'` is used (#33552, @floreks)
- Update GCI base image: (#34156, @adityakali)
 - Enabled VXLAN and IP_SET config options in kernel to support some networking tools (ebtools)
 - OpenSSL CVE fixes
- ContainerVm/GCI image: try to use ifdown/ifup if available (#33595, @freehan)
- Use manifest digest (as `docker-pullable://`) as ImageID when available (exposes a canonical, pullable image ID for containers). (#33014, @DirectXMan12)
- Add kubelet awareness to taint tolerant match calculator. (#26501, @resouer)
- Fix nil pointer issue when getting metrics from volume mounter (#34251, @jingxu97)
- Enforce Disk based pod eviction with GCI base image in Kubelet (#33520, @vishh)
- Remove headers that are unnecessary for proxy target (#34076, @mbohlool)
- Add missing argument to log message in federated ingress controller. (#34158, @quinton-hoole)
- The kubelet `--eviction-minimum-reclaim` option can now take percentages as well as absolute values for resources quantities (#33392, @sjenning)
- The implicit registration of Prometheus metrics for workqueue has been

removed, and a plug-able interface was added. If you were using workqueue in your own binaries and want these metrics, add the following to your imports in the main package: “k8s.io/pkg/util/workqueue/prometheus”. (#33792, @caesarxuchao)

- Add `kubectl --node-port` option for specifying the service nodeport (#33319, @juanvallejo)
- To reduce memory usage to reasonable levels in smaller clusters, kube-apiserver now sets the deserialization cache size based on the target memory usage. (#34000, @wojtekt)
- use service accounts as clients for controllers (#33310, @deads2k)
- Add a new option “--local” to the `kubectl annotate` (#34074, @asalkeld)
- Add a new option “--local” to the `kubectl label` (#33990, @asalkeld)
- Initialize `PodsWithAffinity` to avoid scheduler panic (#33967, @xiang90)
- Fix base image pinning during upgrades via `cluster/gce/upgrade.sh` (#33147, @vishh)
- Remove the flannel experimental overlay (#33862, @luxas)
- CRI: Remove the mount name and port name. (#33970, @yifan-gu)
- Enable `kubectl describe rs` to work when apiserver does not support pods (#33794, @nikhiljindal)
- Heal the namespaceless ingresses in federation e2e. (#33977, @quinton-hoole)
- Fix issue in updating device path when volume is attached multiple times (#33796, @jingxu97)
- ECDSA keys can now be used for signing and verifying service account tokens. (#33565, @liggitt)
- OnlyLocal nodeports (#33587, @bprashanth)
- Remove flannel because now everything here is upstreamed (#33860, @luxas)
- Use patched golang1.7.1 for cross-builds targeting darwin (#33803, @ixdy)
- Bump up addon kube-dns to v20 for graceful termination (#33774, @MrHohn)
- Creating LoadBalancer Service with “None” ClusterIP is no longer possible (#33274, @nebril)
- Increase timeout for federated ingress test. (#33610, @quinton-hoole)
- Use `UpdateStatus`, not `Update`, to add `LoadBalancerStatus` to Federated Ingress. (#33605, @quinton-hoole)
- add anytoken authenticator (#33378, @deads2k)
- Fixes in HPA: consider only running pods; proper denominator in avg request calculations. (#33735, @jszczepkowski)
- When CORS Handler is enabled, we now add a new HTTP header named “Access-Control-Expose-Headers” with a value of “Date”. This allows the “Date” HTTP header to be accessed from XHR/JavaScript. (#33242, @dims)
- promote contrib/mesos to incubator (#33658, @deads2k)
- MinReadySeconds / AvailableReplicas for ReplicaSets (#32771, @kargakis)
- Kubectl drain will now drain finished Pods (#31763, @fraenkel)

- Adds the `-deployment` option to `e2e.go`, adds the ability to run `e2e.go` using a `kops` deployment. (#33518, @zmerlynn)
- Tune down `initialDelaySeconds` for `readinessProbe`. (#33146, @MrHohn)
- `kube-proxy`: Add a lower-bound for `conntrack` (128k default) (#33051, @thockin)
- `local-up-cluster.sh`: add `SERVICE_CLUSTER_IP_RANGE` as option (#32921, @aanm)
- Default HTTP2 on, post fixes from #29001 (#32231, @timothyse)
- Split dns healthcheck into two different urls (#32406, @MrHohn)
- Remove `kubectl namespace` command (#33275, @maciaszczykm)
- Automatic generation of man pages (#33277, @mkumatag)
- Fixes memory/goroutine leak in Federation Service controller. (#33359, @shashidharatd)
- Switch k8s on GCE to use GCI by default (#33353, @vishh)
- Move `HighWaterMark` to the top of the struct in order to fix arm, second time (#33376, @luxas)
- Fix race condition in setting node `statusUpdateNeeded` flag (#32807, @jingxu97)
- Fix the `DOCKER_OPTS` appending bug. (#33163, @DjangoPeng)
- Send recycle events from pod to pv. (#27714, @jsafrane)
- Add port forwarding for rkt with kvm stage1 (#32126, @jjlakis)
- The value of the `versioned.Event` object (returned by watch APIs) in the Swagger 1.2 schemas has been updated from `*versioned.Event` which was not expected by many client tools. The new value is consistent with other structs returned by the API. (#33007, @smarterclayton)
- Remove cpu limits for dns pod to avoid CPU starvation (#33227, @vishh)
- Allow secure access to apiserver from Admission Controllers (#31491, @dims)
- Resolves x509 verification issue with masters dialing nodes when started with `-kubelet-certificate-authority` (#33141, @liggitt)
- Fix possible panic in `PodAffinityChecker` (#33086, @ivan4th)
- Upgrading Container-VM base image for k8s on GCE. Brief changelog as follows: (#32738, @Amey-D)
 - Fixed performance regression in veth device driver
 - Docker and related binaries are statically linked
 - Fixed the issue of systemd being oom-killable
- Move `HighWaterMark` to the top of the struct in order to fix arm (#33117, @luxas)
- `kubenet`: `SyncHostports` for both running and ready to run pods. (#31388, @yifan-gu)
- Limit the number of names per image reported in the node status (#32914, @yujuhong)
- Support Quobyte as `StorageClass` (#31434, @johscheuer)
- Use a patched go1.7.1 for building linux/arm (#32517, @luxas)
- Add line break after events in `kubectl describe` (#31463, @fabianofranz)
- Specific error message on failed rolling update issued by older `kubectl`

- against 1.4 master (#32751, @caesarxuchao)
- Make the informer library available for the go client library. (#32718, @mikedanese)
- Added `-log-facility` flag to enhance dnsmasq logging (#32422, @MrHohn)
- Set Dashboard UI to final 1.4 version (#32666, @bryk)
- Fix `audit_test` regex for iso8601 timestamps (#32593, @johnbieren)
- Docker digest validation is too strict (#32627, @smarterclayton)
- Bumped Heapster to v1.2.0. (#32649, @piosz)
 - More details about the release <https://github.com/kubernetes/heapster/releases/tag/v1.2.0>
- add local subject access review API (#32407, @deads2k)
- make `-runtime-config=api/all=true|false` work (#32582, @jlowdermilk)
- Added new kubelet flags `--cni-bin-dir` and `--cni-conf-dir` to specify where CNI files are located. (#32151, @bboreham)
 - Fixed CNI configuration on GCI platform when using CNI.
- Move `push-ci-build.sh` to `kubernetes/release` repo (#32444, @david-mcmahon)
- vendor: update `github.com/coreos/go-oidc` client package (#31564, @eric-chiang)
- Fixed an issue that caused a credential error when deploying federation control plane onto a GKE cluster. (#31747, @madhusudancs)
- Error if a `contextName` is provided but not found in the `kubeconfig`. (#31767, @asalkeld)
- Use a Deployment for `kube-dns` (#32018, @MrHohn)
- Support graceful termination in `kube-dns` (#31894, @MrHohn)
- When prompting for passwords, don't echo to the terminal (#31586, @brendandburns)
- add group prefix matching for `kubectl` usage (#32140, @deads2k)
- Stick to 2.2.1 `etcd` (#32404, @caesarxuchao)
- Fix a bug in kubelet hostport logic which flushes KUBE-MARK-MASQ iptables chain (#32413, @freehan)
- Make sure finalizers prevent deletion on storage that supports graceful deletion (#32351, @caesarxuchao)
- AWS: Change default networking for `kube-up` to `kubenet` (#32239, @zmerlynn)
- Use `etcd 2.3.7` (#32359, @wojtek-t)
- Allow missing keys in `jsonpath` (#31714, @smarterclayton)
- Changes 'kubectl rollout status' to wait until all updated replicas are available before finishing. (#31499, @areed)
- add `selfsubjectaccessreview` API (#31271, @deads2k)
- Add `kubectl describe` cmd support for vSphere volume (#31045, @abrashivani)
- Enable kubelet eviction whenever inodes free is < 5% on GCE (#31545, @vishh)
- Use federated namespace instead of the bootstrap cluster's namespace in Ingress e2e tests. (#32105, @madhusudancs)
- Move `StorageClass` to a storage group (#31886, @deads2k)

- Some components like kube-dns and kube-proxy could fail to load the service account token when started within a pod. Properly handle empty configurations to try loading the service account config. (#31947, @smarterclayton)
- Removed comments in json config when using kubectl edit with -o json (#31685, @jellonek)
- fixes invalid null selector issue in sysdig example yaml (#31393, @baldwin-SPC)
- Rescheduler which ensures that critical pods are always scheduled enabled by default in GCE. (#31974, @piosz)
- retry oauth token fetch in gce cloudprovider (#32021, @mikedanese)
- Deprecate the old cbr0 and flannel networking modes (#31197, @freehan)
- AWS: fix volume device assignment race condition (#31090, @justinsb)
- The certificates API group has been renamed to certificates.k8s.io (#31887, @liggitt)
- Increase Dashboard UI version to v1.4.0-beta2 (#31518, @bryk)
- Fixed incomplete kubectl bash completion. (#31333, @xingzhou)
- Added liveness probe to Heapster service. (#31878, @mksalawa)
- Adding clusters to the list of valid resources printed by kubectl help (#31719, @nikhiljindal)
- Kubernetes server components using **kubeconfig** files no longer default to **http://localhost:8080**. Administrators must specify a server value in their kubeconfig files. (#30808, @smarterclayton)
- Update influxdb to 0.12 (#31519, @piosz)
- Include security options in the container created event (#31557, @timstclair)
- Federation can now be deployed using the **federation/deploy/deploy.sh** script. This script does not depend on any of the development environment shell library/scripts. This is an alternative to the current **federation-up.sh/federation-down.sh** scripts. Both the scripts are going to co-exist in this release, but the **federation-up.sh/federation-down.sh** scripts might be removed in a future release in favor of **federation/deploy/deploy.sh** script. (#30744, @madhusudancs)
- Add get/delete cluster, delete context to kubectl config (#29821, @alexbrand)
- rkt: Force **rkt fetch** to fetch from remote to conform the image pull policy. (#31378, @yifan-gu)
- Allow services which use same port, different protocol to use the same nodePort for both (#30253, @AdoHe)
- Handle overlapping deployments gracefully (#30730, @janetkuo)
- Remove environment variables and internal Kubernetes Docker labels from cAdvisor Prometheus metric labels. (#31064, @grobie)
 - Old behavior:
 - * environment variables explicitly whitelisted via **-docker-env-metadata-whitelist** were exported as **container_env_***.

- Default is zero so by default non were exported
 - * all docker labels were exported as `container_label_***`
- New behavior:
 - * Only `container_name`, `pod_name`, `namespace`, `id`, `image`, and `name` labels are exposed
 - * no environment variables will be exposed ever via `/metrics`, even if whitelisted
- Filter duplicate network packets in promiscuous bridge mode (with ebttables) (#28717, @freehan)
- Refactor to simplify the hard-traveled path of the KubeletConfiguration object (#29216, @mtaufen)
- Fix overflow issue in controller-manager rate limiter (#31396, @foxish)

Please see the Releases Page for older releases.

Release notes of older releases can be found in: - CHANGELOG-1.2.md - CHANGELOG-1.3.md - CHANGELOG-1.4.md
