

The previous example contained a *default slot*, which renders the direct children of a component. Sometimes you will need more control over placement, such as with this `<ContactCard>`. In those cases, we can use *named slots*.

In `ContactCard.svelte`, add a `name` attribute to each slot:

```
<article class="contact-card">
  <h2>
    <slot name="name">
      <span class="missing">Unknown name</span>
    </slot>
  </h2>

  <div class="address">
    <slot name="address">
      <span class="missing">Unknown address</span>
    </slot>
  </div>

  <div class="email">
    <slot name="email">
      <span class="missing">Unknown email</span>
    </slot>
  </div>
</article>
```

Then, add elements with corresponding `slot="..."` attributes inside the `<ContactCard>` component:

```
<ContactCard>
  <span slot="name">
    P. Sherman
  </span>

  <span slot="address">
    42 Wallaby Way<br>
    Sydney
  </span>
</ContactCard>
```
