

A `#![feature]` attribute was declared for a feature that is stable in the current edition, but not in all editions.

Erroneous code example:

```
ignore (limited to a warning during 2018 edition development)
#![feature(rust_2018_preview)] #![feature(test_2018_feature)] //
error: the feature                               // `test_2018_feature`
is                                              // included in the Rust 2018
edition
```
