## Frame.select() method

Triggers a `change` and `input` event once all the provided options have been selected.

### Signature:

```
select(selector: string, ...values: string[]): Promise<string[]>;
```

## Parameters

Parameter	Type	Description
selector	string	a selector to query the frame for
values	string[]	an array of values to select. If the <code>&lt;select&gt;</code> has the <code>multiple</code> attribute, all values are considered, otherwise only the first one is taken into account.

### Returns:

Promise<string[]>

the list of values that were successfully selected.

## Remarks

If there's no `<select>` element matching `selector`, the method throws an error.

## Example

```
frame.select('select#colors', 'blue'); // single selection
frame.select('select#colors', 'red', 'green', 'blue'); // multiple selections
```
