

knife plugin

This plugin adds completion for knife, a command-line tool to interact with Chef, a platform to automate and manage infrastructure via code.

To use it, add `knife` to the `plugins` array in your `zshrc` file:

```
plugins=(... knife)
```

Options

- `KNIFE_RELATIVE_PATH`: if set to `true`, the completion script will look for local cookbooks under the `cookbooks` folder in the chef root directory. It has preference over the other two options below. **Default:** empty.
- `KNIFE_COOKBOOK_PATH`: if set, it points to the folder that contains local cookbooks, for example: `/path/to/my/chef/cookbooks`. **Default:** `cookbook_path` field in `knife.rb` (see below).
- `KNIFE_CONF_PATH`: variable pointing to the `knife.rb` configuration file, for example `/path/to/my/.chef/knife.rb`. Only used if `$KNIFE_COOKBOOK_PATH` isn't set. If it exists, `$PWD/.chef/knife.rb` is used instead. Otherwise, if it's set, its value is used. **Default:** `$HOME/.chef/knife.rb`.
