```

### General Library Questions

#### How do I find a module or application to perform task X?

Check [:ref: the Library Reference <library-index>](#) to see if there's a relevant standard library module. (Eventually you'll learn what's in the standard library and will be able to skip this step.)

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 17); [backlink](#)**

Unknown interpreted text role "ref".

For third-party packages, search the [Python Package Index](#) or try [Google](#) or another web search engine. Searching for "Python" plus a keyword or two for your topic of interest will usually find something helpful.

#### Where is the math.py (socket.py, regex.py, etc.) source file?

If you can't find a source file for a module it may be a built-in or dynamically loaded module implemented in C, C++ or other compiled language. In this case you may not have the source file or it may be something like [:file: mathmodule.c](#), somewhere in a C source directory (not on the Python Path).

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 30); [backlink](#)**

Unknown interpreted text role "file".

There are (at least) three kinds of modules in Python:

1. modules written in Python (.py);
2. modules written in C and dynamically loaded (.dll, .pyd, .so, .sl, etc);
3. modules written in C and linked with the interpreter; to get a list of these, type:

```
import sys
print(sys.builtin_module_names)
```

#### How do I make a Python script executable on Unix?

You need to do two things: the script file's mode must be executable and the first line must begin with `#!` followed by the path of the Python interpreter.

The first is done by executing `chmod +x scriptfile` or perhaps `chmod 755 scriptfile`.

The second can be done in a number of ways. The most straightforward way is to write

```
#!/usr/local/bin/python
```

as the very first line of your file, using the pathname for where the Python interpreter is installed on your platform.

If you would like the script to be independent of where the Python interpreter lives, you can use the `:program:env` program. Almost all Unix variants support the following, assuming the Python interpreter is in a directory on the user's `:envvar:PATH`:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 64); [backlink](#)**

Unknown interpreted text role "program".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 64); [backlink](#)

Unknown interpreted text role "envvar".

```
#!/usr/bin/env python
```

Don't do this for CGI scripts. The `:envvar:`PATH`` variable for CGI scripts is often very minimal, so you need to use the actual absolute pathname of the interpreter.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 71); [backlink](#)

Unknown interpreted text role "envvar".

Occasionally, a user's environment is so full that the `:program:`/usr/bin/env`` program fails; or there's no `env` program at all. In that case, you can try the following hack (due to Alex Rezinsky):

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 75); [backlink](#)

Unknown interpreted text role "program".

```
#!/bin/sh
"""."""
exec python $0 ${1+"$@"}
"""
```

The minor disadvantage is that this defines the script's `__doc__` string. However, you can fix that by adding

```
__doc__ = """...Whatever..."""
```

### Is there a curses/termcap package for Python?

For Unix variants: The standard Python source distribution comes with a `curses` module in the `:source:`Modules`` subdirectory, though it's not compiled by default. (Note that this is not available in the Windows distribution -- there is no `curses` module for Windows.)

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 98); [backlink](#)

Unknown interpreted text role "source".

The `:mod:`curses`` module supports basic curses features as well as many additional functions from `ncurses` and `SYSV curses` such as colour, alternative character set support, pads, and mouse support. This means the module isn't compatible with operating systems that only have BSD curses, but there don't seem to be any currently maintained OSes that fall into this category.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 103); [backlink](#)

Unknown interpreted text role "mod".

### Is there an equivalent to C's `onexit()` in Python?

The `:mod:`atexit`` module provides a register function that is similar to C's `:c:func:`onexit``.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 113); [backlink](#)

Unknown interpreted text role "mod".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 113); [backlink](#)

Unknown interpreted text role "c:func".

### Why don't my signal handlers work?

The most common problem is that the signal handler is declared with the wrong argument list. It is called as

```
handler(signum, frame)
```

so it should be declared with two parameters:

```
def handler(signum, frame):  
    ...
```

## Common tasks

### How do I test a Python program or component?

Python comes with two testing frameworks. The `mod:doctest` module finds examples in the docstrings for a module and runs them, comparing the output with the expected output given in the docstring.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 137); [backlink](#)**

Unknown interpreted text role "mod".

The `mod:unittest` module is a fancier testing framework modelled on Java and Smalltalk testing frameworks.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 141); [backlink](#)**

Unknown interpreted text role "mod".

To make testing easier, you should use good modular design in your program. Your program should have almost all functionality encapsulated in either functions or class methods -- and this sometimes has the surprising and delightful effect of making the program run faster (because local variable accesses are faster than global accesses). Furthermore the program should avoid depending on mutating global variables, since this makes testing much more difficult to do.

The "global main logic" of your program may be as simple as

```
if __name__ == "__main__":  
    main_logic()
```

at the bottom of the main module of your program.

Once your program is organized as a tractable collection of function and class behaviours, you should write test functions that exercise the behaviours. A test suite that automates a sequence of tests can be associated with each module. This sounds like a lot of work, but since Python is so terse and flexible it's surprisingly easy. You can make coding much more pleasant and fun by writing your test functions in parallel with the "production code", since this makes it easy to find bugs and even design flaws earlier.

"Support modules" that are not intended to be the main module of a program may include a self-test of the module.

```
if __name__ == "__main__":  
    self_test()
```

Even programs that interact with complex external interfaces may be tested when the external interfaces are unavailable by using "fake" interfaces implemented in Python.

### How do I create documentation from doc strings?

The `mod:pydoc` module can create HTML from the doc strings in your Python source code. An alternative for creating API documentation purely from docstrings is [epydoc](#). [Sphinx](#) can also include docstring content.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 181); [backlink](#)**

Unknown interpreted text role "mod".

### How do I get a single keypress at a time?

For Unix variants there are several solutions. It's straightforward to do this using `curses`, but `curses` is a fairly large module to learn.

## Threads

### How do I program using threads?

Be sure to use the `mod:threading` module and not the `mod:_thread` module. The `mod:threading` module builds convenient abstractions on top of the low-level primitives provided by the `mod:_thread` module.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 239); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 239); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 239); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 239); [backlink](#)**

Unknown interpreted text role "mod".

### None of my threads seem to run: why?

As soon as the main thread exits, all threads are killed. Your main thread is running too quickly, giving the threads no time to do any work.

A simple fix is to add a sleep to the end of the program that's long enough for all the threads to finish:

```
import threading, time

def thread_task(name, n):
    for i in range(n):
        print(name, i)

for i in range(10):
    T = threading.Thread(target=thread_task, args=(str(i), i))
    T.start()

time.sleep(10) # <-----!</pre>

```

But now (on many platforms) the threads don't run in parallel, but appear to run sequentially, one at a time! The reason is that the OS thread scheduler doesn't start a new thread until the previous thread is blocked.

A simple fix is to add a tiny sleep to the start of the run function:

```
def thread_task(name, n):
    time.sleep(0.001) # <-----!
    for i in range(n):
        print(name, i)

for i in range(10):
    T = threading.Thread(target=thread_task, args=(str(i), i))
    T.start()

time.sleep(10)
```

Instead of trying to guess a good delay value for `:func:`time.sleep``, it's better to use some kind of semaphore mechanism. One idea is to use the `:mod:`queue`` module to create a queue object, let each thread append a token to the queue when it finishes, and let the main thread read as many tokens from the queue as there are threads.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 282); [backlink](#)**

Unknown interpreted text role "func".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 282); [backlink](#)**

Unknown interpreted text role "mod".

### How do I parcel out work among a bunch of worker threads?

The easiest way is to use the `:mod:`concurrent.futures`` module, especially the `:mod:`~concurrent.futures.ThreadPoolExecutor`` class.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 292); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 292); [backlink](#)**

Unknown interpreted text role "mod".

Or, if you want fine control over the dispatching algorithm, you can write your own logic manually. Use the `mod:queue` module to create a queue containing a list of jobs. The `class:~queue.Queue` class maintains a list of objects and has a `.put(obj)` method that adds items to the queue and a `.get()` method to return them. The class will take care of the locking necessary to ensure that each job is handed out exactly once.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 295); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 295); [backlink](#)**

Unknown interpreted text role "class".

Here's a trivial example:

```
import threading, queue, time

# The worker thread gets jobs off the queue. When the queue is empty, it
# assumes there will be no more work and exits.
# (Realistically workers will run until terminated.)
def worker():
    print('Running worker')
    time.sleep(0.1)
    while True:
        try:
            arg = q.get(block=False)
        except queue.Empty:
            print('Worker', threading.current_thread(), end=' ')
            print('queue empty')
            break
        else:
            print('Worker', threading.current_thread(), end=' ')
            print('running with argument', arg)
            time.sleep(0.5)

# Create queue
q = queue.Queue()

# Start a pool of 5 workers
for i in range(5):
    t = threading.Thread(target=worker, name='worker %i' % (i+1))
    t.start()

# Begin adding work to the queue
for i in range(50):
    q.put(i)

# Give threads time to run
print('Main thread sleeping')
time.sleep(5)
```

When run, this will produce the following output:

**System Message: WARNING/2 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 342)**

Cannot analyze code. No Pygments lexer found for "none".

```
.. code-block:: none
```

```
Running worker
Running worker
```

```
Running worker
Running worker
Running worker
Main thread sleeping
Worker <Thread(worker 1, started 130283832797456)> running with argument 0
Worker <Thread(worker 2, started 130283824404752)> running with argument 1
Worker <Thread(worker 3, started 130283816012048)> running with argument 2
Worker <Thread(worker 4, started 130283807619344)> running with argument 3
Worker <Thread(worker 5, started 130283799226640)> running with argument 4
Worker <Thread(worker 1, started 130283832797456)> running with argument 5
...
```

Consult the module's documentation for more details; the `~queue.Queue` class provides a featureful interface.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 358); [backlink](#)

Unknown interpreted text role "class".

### What kinds of global value mutation are thread-safe?

A `term` `global interpreter lock` (GIL) is used internally to ensure that only one thread runs in the Python VM at a time. In general, Python offers to switch among threads only between bytecode instructions; how frequently it switches can be set via `func` `sys.setswitchinterval`. Each bytecode instruction and therefore all the C implementation code reached from each instruction is therefore atomic from the point of view of a Python program.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 365); [backlink](#)

Unknown interpreted text role "term".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 365); [backlink](#)

Unknown interpreted text role "func".

In theory, this means an exact accounting requires an exact understanding of the PVM bytecode implementation. In practice, it means that operations on shared variables of built-in data types (ints, lists, dicts, etc) that "look atomic" really are.

For example, the following operations are all atomic (L, L1, L2 are lists, D, D1, D2 are dicts, x, y are objects, i, j are ints):

```
L.append(x)
L1.extend(L2)
x = L[i]
x = L.pop()
L1[i:j] = L2
L.sort()
x = y
x.field = y
D[x] = y
D1.update(D2)
D.keys()
```

These aren't:

```
i = i+1
L.append(L[-1])
L[i] = L[j]
D[x] = D[x] + 1
```

Operations that replace other objects may invoke those other objects' `meth` `__del__` method when their reference count reaches zero, and that can affect things. This is especially true for the mass updates to dictionaries and lists. When in doubt, use a mutex!

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 399); [backlink](#)

Unknown interpreted text role "meth".

### Can't we get rid of the Global Interpreter Lock?

The `term` `global interpreter lock` (GIL) is often seen as a hindrance to Python's deployment on high-end multiprocessor server machines, because a multi-threaded Python program effectively only uses one CPU, due to the insistence that (almost) all Python

code can only run while the GIL is held.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 410); [backlink](#)

Unknown interpreted text role "term".

Back in the days of Python 1.5, Greg Stein actually implemented a comprehensive patch set (the "free threading" patches) that removed the GIL and replaced it with fine-grained locking. Adam Olsen recently did a similar experiment in his [python-safethread](#) project. Unfortunately, both experiments exhibited a sharp drop in single-thread performance (at least 30% slower), due to the amount of fine-grained locking necessary to compensate for the removal of the GIL.

This doesn't mean that you can't make good use of Python on multi-CPU machines! You just have to be creative with dividing the work up between multiple *processes* rather than multiple *threads*. The `~concurrent.futures.ProcessPoolExecutor` class in the new `mod:concurrent.futures` module provides an easy way of doing so; the `mod:multiprocessing` module provides a lower-level API in case you want more control over dispatching of tasks.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 423); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 423); [backlink](#)

Unknown interpreted text role "mod".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 423); [backlink](#)

Unknown interpreted text role "mod".

Judicious use of C extensions will also help; if you use a C extension to perform a time-consuming task, the extension can release the GIL while the thread of execution is in the C code and allow other threads to get some work done. Some standard library modules such as `mod:zlib` and `mod:hashlib` already do this.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 431); [backlink](#)

Unknown interpreted text role "mod".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 431); [backlink](#)

Unknown interpreted text role "mod".

It has been suggested that the GIL should be a per-interpreter-state lock rather than truly global; interpreters then wouldn't be able to share objects. Unfortunately, this isn't likely to happen either. It would be a tremendous amount of work, because many object implementations currently have global state. For example, small integers and short strings are cached; these caches would have to be moved to the interpreter state. Other object types have their own free list; these free lists would have to be moved to the interpreter state. And so on.

And I doubt that it can even be done in finite time, because the same problem exists for 3rd party extensions. It is likely that 3rd party extensions are being written at a faster rate than you can convert them to store all their global state in the interpreter state.

And finally, once you have multiple interpreters not sharing any state, what have you gained over running each interpreter in a separate process?

## Input and Output

### How do I delete a file? (And other file questions...)

Use `os.remove(filename)` or `os.unlink(filename)`; for documentation, see the `mod:os` module. The two functions are identical; `func:~os.unlink` is simply the name of the Unix system call for this function.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 461); [backlink](#)

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 461); [backlink](#)**

Unknown interpreted text role "func".

To remove a directory, use `:func:`os.rmdir``; use `:func:`os.mkdir`` to create one. `os.makedirs(path)` will create any intermediate directories in `path` that don't exist. `os.removedirs(path)` will remove intermediate directories as long as they're empty; if you want to delete an entire directory tree and its contents, use `:func:`shutil.rmtree``.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 465); [backlink](#)**

Unknown interpreted text role "func".

Unknown interpreted text role "func".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 478); [backlink](#)**

Unknown interpreted text role "func".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 478); [backlink](#)**

Unknown interpreted text role "func".

## How do I copy a file?

The `:mod:`shutil`` module contains a `:func:`~shutil.copyfile`` function. Note that on MacOS 9 it doesn't copy the resource fork and Finder info.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 486); [backlink](#)

Unknown interpreted text role "mod".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 486); [backlink](#)

Unknown interpreted text role "func".

### How do I read (or write) binary data?

To read or write complex binary data formats, it's best to use the `:mod:`struct`` module. It allows you to take a string containing binary data (usually numbers) and convert it to Python objects; and vice versa.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 493); [backlink](#)

Unknown interpreted text role "mod".

For example, the following code reads two 2-byte integers and one 4-byte integer in big-endian format from a file:

```
import struct

with open(filename, "rb") as f:
    s = f.read(8)
    x, y, z = struct.unpack(">hhl", s)
```

The `'>'` in the format string forces big-endian data; the letter `'h'` reads one "short integer" (2 bytes), and `'l'` reads one "long integer" (4 bytes) from the string.

For data that is more regular (e.g. a homogeneous list of ints or floats), you can also use the `:mod:`array`` module.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 510); [backlink](#)

Unknown interpreted text role "mod".

### Note

To read and write binary data, it is mandatory to open the file in binary mode (here, passing `"rb"` to `:func:`open``). If you use `"r"` instead (the default), the file will be open in text mode and `f.read()` will return `:class:`str`` objects rather than `:class:`bytes`` objects.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 515); [backlink](#)

Unknown interpreted text role "func".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 515); [backlink](#)

Unknown interpreted text role "class".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 515); [backlink](#)

Unknown interpreted text role "class".

### I can't seem to use `os.read()` on a pipe created with `os.popen()`; why?

`:func:`os.read`` is a low-level function which takes a file descriptor, a small integer representing the opened file. `:func:`os.popen`` creates a high-level file object, the same type returned by the built-in `:func:`open`` function. Thus, to read `n` bytes from a pipe `p` created with `:func:`os.popen``, you need to use `p.read(n)`.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 525); [backlink](#)

Unknown interpreted text role "func".

### How do I access the serial (RS232) port?

For Win32, OSX, Linux, BSD, Jython, IronPython:

<https://pypi.org/project/pyserial/>

For Unix, see a Usenet post by Mitch Chapman:

<https://groups.google.com/groups?selm=34A04430.CF9@ohioee.com>

### Why doesn't closing `sys.stdout` (`stdin`, `stderr`) really close it?

Python `term` file objects `<file object>` are a high-level layer of abstraction on low-level C file descriptors.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 626); [backlink](#)

Unknown interpreted text role "term".

For most file objects you create in Python via the built-in `func:open` function, `f.close()` marks the Python file object as being closed from Python's point of view, and also arranges to close the underlying C file descriptor. This also happens automatically in `f`'s destructor, when `f` becomes garbage.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 629); [backlink](#)

Unknown interpreted text role "func".

But `stdin`, `stdout` and `stderr` are treated specially by Python, because of the special status also given to them by C. Running `sys.stdout.close()` marks the Python-level file object as being closed, but does *not* close the associated C file descriptor.

To close the underlying C file descriptor for one of these three, you should first be sure that's what you really want to do (e.g., you may confuse extension modules trying to do I/O). If it is, use `func:os.close`:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 640); [backlink](#)

Unknown interpreted text role "func".

```
os.close(stdin.fileno())
os.close(stdout.fileno())
os.close(stderr.fileno())
```

Or you can use the numeric constants 0, 1 and 2, respectively.

## Network/Internet Programming

### What WWW tools are there for Python?

See the chapters titled `:ref: internet` and `:ref: netdata` in the Library Reference Manual. Python has many modules that will help you build server-side and client-side web systems.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 657); [backlink](#)**

Unknown interpreted text role "ref".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 657); [backlink](#)**

Unknown interpreted text role "ref".

A summary of available frameworks is maintained by Paul Boddie at <https://wiki.python.org/moin/WebProgramming>.

Cameron Laird maintains a useful set of pages about Python web technologies at [http://phaseit.net/claird/comp.lang.python/web\\_python](http://phaseit.net/claird/comp.lang.python/web_python).

### How can I mimic CGI form submission (METHOD=POST)?

I would like to retrieve web pages that are the result of POSTing a form. Is there existing code that would let me do this easily?

Yes. Here's a simple example that uses `:mod: urllib.request`:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 676); [backlink](#)**

Unknown interpreted text role "mod".

```
#!/usr/local/bin/python

import urllib.request

# build the query string
qs = "First=Josephine&MI=Q&Last=Public"

# connect and send the server a path
req = urllib.request.urlopen('http://www.some-server.out-there'
                              '/cgi-bin/some-cgi-script', data=qs)

with req:
    msg, hdrs = req.read(), req.info()
```

Note that in general for percent-encoded POST operations, query strings must be quoted using `:func: urllib.parse.urlencode`. For example, to send `name=Guy Steele, Jr.`:

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 691); [backlink](#)**

Unknown interpreted text role "func".

```
>>> import urllib.parse
>>> urllib.parse.urlencode({'name': 'Guy Steele, Jr.})
'name=Guy+Steele%2C+Jr.'
```

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\[cpython-main] [Doc] [faq] library.rst, line 699)**

Unknown directive type "seealso".

```
.. seealso:: :ref: `urllib-howto` for extensive examples.
```

### What module should I use to help with generating HTML?

You can find a collection of useful links on the [Web Programming wiki page](#).

### How do I send mail from a Python script?

Use the standard library module `:mod: smtplib`.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-**

**main\Doc\faq\cpython-main** [Doc] [faq] library.rst, line 714); [backlink](#)

Unknown interpreted text role "mod".

Here's a very simple interactive mail sender that uses it. This method will work on any host that supports an SMTP listener.

```
import sys, smtplib

fromaddr = input("From: ")
toaddrs = input("To: ").split(',')
print("Enter message, end with ^D:")
msg = ''
while True:
    line = sys.stdin.readline()
    if not line:
        break
    msg += line

# The actual mail send
server = smtplib.SMTP('localhost')
server.sendmail(fromaddr, toaddrs, msg)
server.quit()
```

A Unix-only alternative uses sendmail. The location of the sendmail program varies between systems; sometimes it is /usr/lib/sendmail, sometimes /usr/sbin/sendmail. The sendmail manual page will help you out. Here's some sample code:

```
import os

SENDMAIL = "/usr/sbin/sendmail" # sendmail location
p = os.popen("%s -t -i" % SENDMAIL, "w")
p.write("To: receiver@example.com\n")
p.write("Subject: test\n")
p.write("\n") # blank line separating headers from body
p.write("Some text\n")
p.write("some more text\n")
sts = p.close()
if sts != 0:
    print("Sendmail exit status", sts)
```

### How do I avoid blocking in the connect() method of a socket?

The `mod:`select`` module is commonly used to help with asynchronous I/O on sockets.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main) [Doc] [faq] library.rst, line 758); [backlink](#)

Unknown interpreted text role "mod".

To prevent the TCP connect from blocking, you can set the socket to non-blocking mode. Then when you do the `meth:`socket.connect``, you will either connect immediately (unlikely) or get an exception that contains the error number as `.errno`. `errno.EINPROGRESS` indicates that the connection is in progress, but hasn't finished yet. Different OSes will return different values, so you're going to have to check what's returned on your system.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main) [Doc] [faq] library.rst, line 761); [backlink](#)

Unknown interpreted text role "meth".

You can use the `meth:`socket.connect_ex`` method to avoid creating an exception. It will just return the `errno` value. To poll, you can call `meth:`socket.connect_ex`` again later -- 0 or `errno.EISCONN` indicate that you're connected -- or you can pass this socket to `meth:`select.select`` to check if it's writable.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main) [Doc] [faq] library.rst, line 768); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main) [Doc] [faq] library.rst, line 768); [backlink](#)

Unknown interpreted text role "meth".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 768); [backlink](#)**

Unknown interpreted text role "meth".

#### Note

The `mod: 'asyncio'` module provides a general purpose single-threaded and concurrent asynchronous library, which can be used for writing non-blocking network code. The third-party [Twisted](#) library is a popular and feature-rich alternative.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 774); [backlink](#)**

Unknown interpreted text role "mod".

## Databases

### Are there any interfaces to database packages in Python?

Yes.

Interfaces to disk-based hashes such as `mod: 'DBM <dbm.ndbm>'` and `mod: 'GDBM <dbm.gnu>'` are also included with standard Python. There is also the `mod: 'sqlite3'` module, which provides a lightweight disk-based relational database.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 789); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 789); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 789); [backlink](#)**

Unknown interpreted text role "mod".

Support for most relational databases is available. See the [DatabaseProgramming wiki page](#) for details.

### How do you implement persistent objects in Python?

The `mod: 'pickle'` library module solves this in a very general way (though you still can't store things like open files, sockets or windows), and the `mod: 'shelve'` library module uses pickle and (g)dbm to create persistent mappings containing arbitrary Python objects.

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 802); [backlink](#)**

Unknown interpreted text role "mod".

**System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\ [cpython-main] [Doc] [faq] library.rst, line 802); [backlink](#)**

Unknown interpreted text role "mod".

## Mathematics and Numerics

### How do I generate random numbers in Python?

The standard module `mod: 'random'` implements a random number generator. Usage is simple:

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\faq\cpython-main [Doc] [faq] library.rst, line 814); [backlink](#)

Unknown interpreted text role "mod".

```
import random
random.random()
```

This returns a random floating point number in the range [0, 1).

There are also many other specialized generators in this module, such as:

- `randrange(a, b)` chooses an integer in the range [a, b).
- `uniform(a, b)` chooses a floating point number in the range [a, b).
- `normalvariate(mean, sdev)` samples the normal (Gaussian) distribution.

Some higher-level functions operate on sequences directly, such as:

- `choice(S)` chooses a random element from a given sequence.
- `shuffle(L)` shuffles a list in-place, i.e. permutes it randomly.

There's also a `Random` class you can instantiate to create independent multiple random number generators.
