

# Image Component Example

This example shows how to use the [Image Component in Next.js](#) serve optimized, responsive images.

The index page ( [pages/index.js](#) ) has a couple images, one internal image and one external image. In [next.config.js](#) , the `domains` property is used to enable external images. The other pages demonstrate the different layouts. Run or deploy the app to see how it works!

## Live demo

<https://image-component.nextjs.gallery/>

## Deploy your own

Deploy the example using [Vercel](#) or preview live with [StackBlitz](#)

## How to use

Execute [create-next-app](#) with [npm](#) or [Yarn](#) to bootstrap the example:

```
npx create-next-app --example image-component image-app
# or
yarn create next-app --example image-component image-app
# or
pnpm create next-app -- --example image-component image-app
```

Deploy it to the cloud with [Vercel](#) ([Documentation](#)).
