

Font-Awesome includes some great file type icons, like *fa-file-word-o*, but when using the font programmatically, these classes are not as helpful as if the classes relied on the actual file extensions, like *fa-file-**doc**-o* or *fa-file-**docx**-o*.

The following jsfiddle example shows how you can edit or override the css to include these classes as well as a JavaScript example of how this can be used.
