

Git Escape Magic

This plugin is copied from the original at <https://github.com/knu/zsh-git-escape-magic>. All credit for the functionality enabled by this plugin should go to @knu.

An excerpt from that project's readme explains its purpose.

It eliminates the need for manually escaping those meta-characters. The `zle` function it provides is context aware and recognizes the characteristics of each subcommand of `git`. Every time you type one of these meta-characters on a `git` command line, it automatically escapes the meta-character with a backslash as necessary and as appropriate.

Usage

To use this plugin, add it to your list of plugins in your `.zshrc` file.

NOTE: If you use `url-quote-magic`, it must be included before this plugin runs to prevent any conflicts.
