

What's New In Python 3.11

Release: [|release|](#)
Date: [|today|](#)

This article explains the new features in Python 3.11, compared to 3.10.

For full details, see the [ref`changelog <changelog>`](#).

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 50); [backlink](#)

Unknown interpreted text role "ref".

Note

Prerelease users should be aware that this document is currently in draft form. It will be updated substantially as Python 3.11 moves towards release, so it's worth checking back even after reading earlier versions.

Summary -- Release highlights

- Python 3.11 is up to 10-60% faster than Python 3.10. On average, we measured a 1.22x speedup on the standard benchmark suite. See [Faster CPython](#) for details.

New syntax features:

- [PEP 654](#): Exception Groups and `except*`. (Contributed by Irit Katriel in [:issue:`45292`](#).)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 72); [backlink](#)

Unknown interpreted text role "issue".

New typing features:

- [PEP 673](#): `Self` Type. (Contributed by James Hilton-Balfé and Pradeep Kumar in [:issue:`30924`](#).)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 77); [backlink](#)

New Features

Enhanced error locations in tracebacks

When printing tracebacks, the interpreter will now point to the exact expression that caused the error instead of just the line. For example:

```
Traceback (most recent call last):
  File "distance.py", line 11, in <module>
    print(manhattan_distance(p1, p2))
    ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
  File "distance.py", line 6, in manhattan_distance
    return abs(point_1.x - point_2.x) + abs(point_1.y - point_2.y)
           ^^^^^^^^^
AttributeError: 'NoneType' object has no attribute 'x'
```

Previous versions of the interpreter would point to just the line making it ambiguous which object was `None`. These enhanced errors can also be helpful when dealing with deeply nested dictionary objects and multiple function calls,

```
Traceback (most recent call last):
  File "query.py", line 37, in <module>
    magic_arithmetic('foo')
    ^^^^^^^^^^^^^^^^^^^^^^^
  File "query.py", line 18, in magic_arithmetic
    return add_counts(x) / 25
```

```

^^^^^^^^^^^^^^^^
File "query.py", line 24, in add_counts
    return 25 + query_user(user1) + query_user(user2)
    ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
File "query.py", line 32, in query_user
    return 1 + query_count(db, response['a']['b']['c']['user'], retry=True)
    ~~~~~^~~~~
TypeError: 'NoneType' object is not subscriptable

```

as well as complex arithmetic expressions:

```

Traceback (most recent call last):
  File "calculation.py", line 54, in <module>
    result = (x / y / z) * (a / b / c)
    ~~~~~^~~~
ZeroDivisionError: division by zero

```

See [PEP 657](#) for more details. (Contributed by Pablo Galindo, Batuhan Taskaya and Ammar Askar in [issue:43950](#).)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 133); [backlink](#)

Unknown interpreted text role "issue".

Note

This feature requires storing column positions in code objects which may result in a small increase of disk usage of compiled Python files or interpreter memory usage. To avoid storing the extra information and/or deactivate printing the extra traceback information, the `:option:-X no_debug_ranges` command line flag or the `:envvar:PYTHONNODEBUGRANGES` environment variable can be used.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 137); [backlink](#)

Unknown interpreted text role "option".

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 137); [backlink](#)

Unknown interpreted text role "envvar".

Column information for code objects

The information used by the enhanced traceback feature is made available as a general API that can be used to correlate bytecode instructions with source code. This information can be retrieved using:

- The `:meth:`codeobject.co_positions`` method in Python.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 151); [backlink](#)

Unknown interpreted text role "meth".

- The `:c:func:PyCode_Addr2Location` function in the C-API.

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 152); [backlink](#)

Unknown interpreted text role "c:func".

The `:option:-X no_debug_ranges` option and the environment variable `:envvar:PYTHONNODEBUGRANGES` can be used to disable this feature.

Exceptions can be enriched with a string `__note__`

The `__note__` field was added to `:exc:`BaseException``. It is `None` by default but can be set to a string which is added to the exception's traceback. (Contributed by Irit Katriel in [issue:45607](#).)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 163); [backlink](#)

Unknown interpreted text role "issue".

Other Language Changes

- Starred expressions can be used in `:ref`for statements<for>``. (See [issue:46725](#) for more details.)

System Message: ERROR/3 (D:\onboarding-resources\sample-onboarding-resources\cpython-main\Doc\whatsnew\ [cpython-main] [Doc] [whatsnew] 3.11.rst, line 170); [backlink](#)

- `siphash13` is added as a new internal hashing algorithms. It has similar security properties as `siphash24` but it is slightly faster for long inputs. `str`, `bytes`, and some other types now use it as default algorithm for `:func:`hash``. PEP 552 hash-based pyc files now use `siphash13`, too. (Contributed by Inada Naoki in [:issue:`29410`](#).)

- When an active exception is re-raised by a `:keyword:`raise`` statement with no parameters, the traceback attached to this exception is now always `sys.exc_info()[1].__traceback__`. This means that changes made to the traceback in the current `:keyword:`except`` clause are reflected in the re-raised exception. (Contributed by Irit Katriel in [:issue:`45711`](#).)

sysconfig

- Two new `ref: installation schemes <installation_paths>` (`posix_venv`, `nt_venv` and `venv`) were added and are used when Python creates new virtual environments or when it is running from a virtual environment. The first two schemes (`posix_venv` and `nt_venv`) are OS-specific for non-Windows and Windows, the `venv` is essentially an alias to one of them according to the OS Python runs on. This is useful for downstream distributors who modify `func: sysconfig.get_preferred_scheme`. Third party code that creates new virtual environments should use the new `venv` installation scheme to determine the paths, as does `mod: venv`. (Contributed by Miro Hrončok in `issue: 45413`.)

Previously in 3.10, Python module execution looked like this:

Read `__pycache__` -> Unmarshal -> Heap allocated code object -> Evaluate

In Python 3.11, the core modules essential for Python startup are "frozen". This means that their code objects (and bytecode) are statically allocated by the interpreter. This reduces the steps in module execution process to this:

Statically allocated code object -> Evaluate

Interpreter startup is now 10-15% faster in Python 3.11. This has a big impact for short-running programs using Python.

Faster Runtime

Cheaper, lazy Python frames

Python frames are created whenever Python calls a Python function. This frame holds execution information. The following are new frame optimizations:

- Streamlined the frame creation process.
- Avoided memory allocation by generously re-using frame space on the C stack.
- Streamlined the internal frame struct to contain only essential information. Frames previously held extra debugging and memory management information.

Old-style frame objects are now created only when required by debuggers. For most user code, no frame objects are created at all. As a result, nearly all Python functions calls have sped up significantly. We measured a 3-7% speedup in pyperformance.

Inlined Python function calls

During a Python function call, Python will call an evaluating C function to interpret that function's code. This effectively limits pure Python recursion to what's safe for the C stack.

In 3.11, when CPython detects Python code calling another Python function, it sets up a new frame, and "jumps" to the new code inside the new frame. This avoids calling the C interpreting function altogether.

Most Python function calls now consume no C stack space. This speeds up most of such calls. In simple recursive functions like fibonacci or factorial, a 1.7x speedup was observed. This also means recursive functions can recurse significantly deeper (if the user increases the recursion limit). We measured a 1-3% improvement in pyperformance.

PEP 659: Specializing Adaptive Interpreter

[PEP 659](#) is one of the key parts of the faster CPython project. The general idea is that while Python is a dynamic language, most code has regions where objects and types rarely change. This concept is known as *type stability*.

At runtime, Python will try to look for common patterns and type stability in the executing code. Python will then replace the current operation with a more specialized one. This specialized operation uses fast paths available only to those use cases/types, which generally outperform their generic counterparts. This also brings in another concept called *inline caching*, where Python caches the results of expensive operations directly in the bytecode.

The specifier will also combine certain common instruction pairs into one superinstruction. This reduces the overhead during execution.

Python will only specialize when it sees code that is "hot" (executed multiple times). This prevents Python from wasting time for run-once code. Python can also de-specialize when code is too dynamic or when the use changes. Specialization is attempted periodically, and specialization attempts are not too expensive. This allows specialization to adapt to new circumstances.

(PEP written by Mark Shannon, with ideas inspired by Stefan Brunthaler. See [PEP 659](#) for more information.)

FAQ

Q: How should I write my code to utilize these speedups?

A: You don't have to change your code. Write Pythonic code that follows common best practices. The Faster CPython project optimizes for common code patterns we observe.

Q: Will CPython 3.11 use more memory?

A: Maybe not. We don't expect memory use to exceed 20% more than 3.10. This is offset by memory optimizations for frame objects and object dictionaries as mentioned above.

Q: I don't see any speedups in my workload. Why?

A: Certain code won't have noticeable benefits. If your code spends most of its time on I/O operations, or already does most of its computation in a C extension library like numpy, there won't be significant speedup. This project currently benefits pure-Python workloads the most.

Furthermore, the pyperformance figures are a geometric mean. Even within the pyperformance benchmarks, certain benchmarks have slowed down slightly, while others have sped up by nearly 2x!

Q: Is there a JIT compiler?

A: No. We're still exploring other optimizations.

Porting to Python 3.11

- The old trashcan macros (`Py_TRASHCAN_SAFE_BEGIN/Py_TRASHCAN_SAFE_END`) are now deprecated. They should be replaced by the new macros `Py_TRASHCAN_BEGIN` and `Py_TRASHCAN_END`.

A `tp_dealloc` function that has the old macros, such as:

```
static void
mytype_dealloc(mytype *p)
```

```

{
    PyObject_GC_UnTrack(p);
    Py_TRASHCAN_SAFE_BEGIN(p);
    ...
    Py_TRASHCAN_SAFE_END
}

```

should migrate to the new macros as follows:

```

static void
mytype_dealloc(mytype *p)
{
    PyObject_GC_UnTrack(p);
    Py_TRASHCAN_BEGIN(p, mytype_dealloc)
    ...
    Py_TRASHCAN_END
}

```

Note that `Py_TRASHCAN_BEGIN` has a second argument which should be the deallocation function it is in.

To support older Python versions in the same codebase, you can define the following macros and use them throughout the code (credit: these were copied from the `mypy` codebase):

```

#if PY_MAJOR_VERSION >= 3 && PY_MINOR_VERSION >= 8
# define CPy_TRASHCAN_BEGIN(op, dealloc) Py_TRASHCAN_BEGIN(op, dealloc)
# define CPy_TRASHCAN_END(op) Py_TRASHCAN_END
#else
# define CPy_TRASHCAN_BEGIN(op, dealloc) Py_TRASHCAN_SAFE_BEGIN(op)
# define CPy_TRASHCAN_END(op) Py_TRASHCAN_SAFE_END(op)
#endif

```

- The `:cfunc:'PyType_Ready'` function now raises an error if a type is defined with the `:const:'Py_TPFLAGS_HAVE_GC'` flag set but has no traverse function (`:cmember:'PyTypeObject.tp_traverse'`). (Contributed by Victor Stinner in [issue: 44263](#).)
