

Threw `undefined` / `null`

Why This Error Occurred

Somewhere in your code you `throw` an `undefined` or `null` value. Since this isn't a valid error there isn't a stack trace. We show this error instead to let you know what to look for.

```
function getData() {  
  let error  
  throw error  
}  
  
function Page() {  
  const error = data?.error || null  
  throw error  
}
```

Possible Ways to Fix It

Look in your pages and find where an error could be throwing `undefined` or `null` values and ensure `new Error()` is used instead.
