

Implements the Angular Router service , which enables navigation from one view to the next as users perform application tasks.

Defines the **Route** object that maps a URL path to a component, and the **RouterOutlet** directive that you use to place a routed view in a template, as well as a complete API for configuring, querying, and controlling the router state.

Import **RouterModule** to use the Router service in your app. For more usage information, see the Routing and Navigation guide.
