Emscripten builds cannot handle signals in the usual way due to platform limitations. Python can now handle signals. To use, set `Module.Py_EmscriptenSignalBuffer` to be a single byte `SharedArrayBuffer` and set `Py_EMSCRIPTEN_SIGNAL_HANDLING` to 1. Define `posix_venv` and `nt_venv` [ref: sysconfig installation schemes <installation\\_paths>](#) to be used for bootstrapping new virtual environments. Add `venv` sysconfig installation scheme to get the appropriate one of the above. The schemes are identical to the pre-existing `posix_prefix` and `nt` install schemes. The `mod:venv` module now uses the `venv` scheme to create new virtual environments instead of hardcoding the paths depending only on the platform. Downstream Python distributors customizing the `posix_prefix` or `nt` install scheme in a way that is not compatible with the install scheme used in virtual environments are encouraged not to customize the `venv` schemes. When Python itself runs in a virtual environment, `func:sysconfig.get_default_scheme` and `func:sysconfig.get_preferred_scheme` with `key="prefix"` returns `venv`.
