

It can be useful to know when transitions are beginning and ending. Svelte dispatches events that you can listen to like any other DOM event:

```
<p
  transition:fly="{{ y: 200, duration: 2000 }}"
  on:introstart="{ () => status = 'intro started' }"
  on:outrostart="{ () => status = 'outro started' }"
  on:introend="{ () => status = 'intro ended' }"
  on:outroend="{ () => status = 'outro ended' }"
>
  Flies in and out
</p>
```
