

@name Missing Token @category compiler @shortDescription No suitable injection token for parameter

@description There is no injection token for a constructor parameter at compile time. InjectionTokens are tokens that can be used in a Dependency Injection Provider.

@debugging Look at the parameter that throws the error and all uses of the class. This error is commonly thrown when a constructor defines parameters with primitive types like `string`, `number`, `boolean`, and `Object`.

Use the `@Injectable` method or `@Inject` decorator from `@angular/core` to ensure that the type you are injecting is reified (has a runtime representation). Make sure to add a provider to this decorator so that you do not throw NG0201: No Provider Found.
