## Pulse-Width Modulation (PWM)

Pulse-width modulation is a modulation technique primarily used to control power supplied to electrical devices.

The PWM framework provides an abstraction for providers and consumers of PWM signals. A controller that provides one or more

PWM signals is registered as `:ctype:'struct pwm_chip <pwm_chip>'`. Providers are expected to embed this structure in a driver-specific structure. This structure contains fields that describe a particular chip.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\driver-api\linux-master) (Documentation) (driver-api)miscellaneous.rst, line 31); [backlink](#)

Unknown interpreted text role "ctype".

A chip exposes one or more PWM signal sources, each of which exposed as a `:ctype:'struct pwm_device <pwm_device>'`. Operations can be performed on PWM devices to control the period, duty cycle, polarity and active state of the signal.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\driver-api\linux-master) (Documentation) (driver-api)miscellaneous.rst, line 37); [backlink](#)

Unknown interpreted text role "ctype".

Note that PWM devices are exclusive resources: they can always only be used by one consumer at a time.

**System Message: ERROR/3** (D:\onboarding-resources\sample-onboarding-resources\linux-master\Documentation\driver-api\linux-master) (Documentation) (driver-api)miscellaneous.rst, line 45)
