

@name Export Not Found @category runtime @videoUrl <https://www.youtube.com/embed/fUSAg4kp2WQ>  
@shortDescription Export not found!

@description Angular can't find a directive with `{{ PLACEHOLDER }}` export name. The export name is specified in the `exportAs` property of the directive decorator. This is common when using `FormsModule` or `Material` modules in templates, and you've forgotten to import the corresponding modules.

This is the runtime equivalent of a common compiler error NG8003: No directive found with export.

@debugging Use the export name to trace the templates or modules using this export.

Ensure that all dependencies are properly imported and declared in your Ng-Modules. For example, if the export not found is `ngForm`, we need to import `FormsModule` and declare it in the list of imports in `*.module.ts` to resolve the error.

```
import { FormsModule } from '@angular/forms';
```

```
@NgModule({  
  ...  
  imports: [  
    FormsModule,  
    ...  
  ],  
})
```

If you recently added an import, you may need to restart your server to see these changes.
