

Fast Start

Fast Start is an experimental development for Flutter on Android that should startup faster on slower hardware. The APK used to install Flutter will only contain a minimal bootstrap application, which will require it to be rebuilt and reinstalled less frequently. This workflow may not work if you're using `android_alarm_manager`, or other plugins which start background isolates.

Fast start can be used by providing `-fast-start` as a command line option to `flutter run`. The first time this is used an APK must still be built, but on subsequent runs it will start up much faster. Note switching between `-fast-start` and regular development modes will still require the APK to be rebuilt.
