

Gatsby exposes its internal data store and query capabilities to GraphQL field resolvers on `context.nodeModel` .

Example Usage

```
createResolvers({
  Query: {
    mood: {
      type: `String`,
      resolve: async (source, args, context, info) => {
        const item = await context.nodeModel.findOne({ type: `Coffee` })
        if (!item) {
          return 😞
        }
        return 😊
      },
    },
  },
})
```
