

A turn-key user interface for Meteor Accounts.

To add Accounts and a set of login controls to an application, add the `accounts-ui` package and at least one login provider package: `accounts-password`, `accounts-facebook`, `accounts-github`, `accounts-google`, `accounts-twitter`, or `accounts-weibo`.

Then simply add the `{% raw %}{{> loginButtons}}{% endraw %}` helper to an HTML file. This will place a login widget on the page. If there is only one provider configured and it is an external service, this will add a login/logout button. If you use `accounts-password` or use multiple external login services, this will add a "Sign in" link which opens a dropdown menu with login options. If you plan to position the login dropdown in the right edge of the screen, use `{% raw %}{{> loginButtons align="right"}}{% endraw %}` in order to get the dropdown to lay itself out without expanding off the edge of the screen.

To configure the behavior of `{% raw %}{{> loginButtons}}{% endraw %}`, use [Accounts.ui.config](#).

`accounts-ui` also includes modal popup dialogs to handle links from [sendResetPasswordEmail](#), [sendVerificationEmail](#), and [sendEnrollmentEmail](#). These do not have to be manually placed in HTML: they are automatically activated when the URLs are loaded.

If you want to control the look and feel of your accounts system a little more, we recommend reading the [useraccounts](#) section of the Meteor Guide.
