Add a panel to a dashboard

Panels allow you to show your data in visual form. Each panel needs at least one query to display a visualization.

Before you begin

- Ensure that you have the proper permissions. For more information about permissions, refer to [About users and permissions]({{< relref “../administration/manage-users-and-permissions/about-users-and-permissions.md” >}}).
- Identify the dashboard to which you want to add the panel.
- Understand the query language of the target data source.
- Ensure that data source for which you are writing a query has been added. For more information about adding a data source, refer to [Add a data source]({{< relref “../datasources/add-a-data-source.md” >}}) if you need instructions.

To add a panel to a dashboard:

1. Navigate to the dashboard to which you want to add a panel.
2. Click the **Add panel** icon.
3. Click **Add an empty panel**.

Grafana creates an empty time-series panel and selects the default data source.
4. In the first line of the **Query** tab, click the drop-down list and select a data source.
5. Write or construct a query in the query language of your data source.

For more information about data sources, refer to [Data sources]({{< relref “../datasources/_index.md” >}}) for specific guidelines.
6. In the Visualization list, select a visualization type.

Grafana displays a preview of your query results with the visualization applied.

For more information about individual visualizations, refer to [Visualizations options]({{< relref “../visualizations/_index.md” >}}).
7. Refer to the following documentation for ways you adjust panel settings.

While not required, most visualizations need some adjustment before they properly display the information that you need.

- [Format data using value mapping]({{< relref "../format-data/about-value-mapping.md" >}})
 - [Visualization-specific options]({{< relref "../visualizations/_index.md" >}})
 - [Override field values]({{< relref "../override-field-values/about-field-overrides.md" >}})
 - [Specify thresholds to set the color of visualization text and background]({{< relref "../specify-thresholds/about-thresholds.md" >}})
 - [Apply color to series and fields]({{< relref "../apply-color-to-series.md" >}})
8. Add a note to describe the visualization (or describe your changes) and then click **Save** in the upper-right corner of the page.

Notes can be helpful if you need to revert the dashboard to a previous version.
