

Using a local plugin

This example demonstrates usage of a local plugin – in this case a source plugin.

You might also be interested in the docs section on local plugins, or the source plugin tutorial.

Using Gatsby’s GraphQL integration layer

This example site is also intended as a direct comparison to the `using-gatsby-without-graphql`, which illustrates how to use an “unstructured data” approach (or, without making use of the GraphQL integration layer).

Sourcing data using a local plugin

This example uses a local plugin to:

1. Load data from the PokéAPI’s REST endpoints
2. Process that data into Gatsby’s node format
3. Use the `createNode` action to add the data to Gatsby’s GraphQL layer

The `gatsby-node.js` file of the local plugin includes detailed comments on the process.

Examples loading multiple local plugins outside the plugins folder

To see how to load multiple plugins from outside the plugins folder, refer to the `using-multiple-local-plugins` example repository.
