

# Ioctl Numbers

19 October 1999

Michael Elizabeth Chastain <[mec@shout.net](mailto:mec@shout.net)>

If you are adding new ioctl's to the kernel, you should use the `_IO` macros defined in `<linux/ioctl.h>`:

<code>_IO</code>	an	ioctl with no parameters
<code>_IOW</code>	an	ioctl with write parameters (copy_from_user)
<code>_IOR</code>	an	ioctl with read parameters (copy_to_user)
<code>_IOWR</code>	an	ioctl with both write and read parameters.

'Write' and 'read' are from the user's point of view, just like the system calls 'write' and 'read'. For example, a `SET_FOO` ioctl would be `_IOW`, although the kernel would actually read data from user space; a `GET_FOO` ioctl would be `_IOR`, although the kernel would actually write data to user space.

The first argument to `_IO`, `_IOW`, `_IOR`, or `_IOWR` is an identifying letter or number from the table below. Because of the large number of drivers, many drivers share a partial letter with other drivers.

If you are writing a driver for a new device and need a letter, pick an unused block with enough room for expansion: 32 to 256 ioctl commands. You can register the block by patching this file and submitting the patch to Linus Torvalds. Or you can e-mail me at <[mec@shout.net](mailto:mec@shout.net)> and I'll register one for you.

The second argument to `_IO`, `_IOW`, `_IOR`, or `_IOWR` is a sequence number to distinguish ioctls from each other. The third argument to `_IOW`, `_IOR`, or `_IOWR` is the type of the data going into the kernel or coming out of the kernel (e.g. 'int' or 'struct foo'). NOTE! Do NOT use `sizeof(arg)` as the third argument as this results in your ioctl thinking it passes an argument of type `size_t`.

Some devices use their major number as the identifier; this is OK, as long as it is unique. Some devices are irregular and don't follow any convention at all.

Following this convention is good because:

1. Keeping the ioctl's globally unique helps error checking: if a program calls an ioctl on the wrong device, it will get an error rather than some unexpected behaviour.
2. The 'strace' build procedure automatically finds ioctl numbers defined with `_IO`, `_IOW`, `_IOR`, or `_IOWR`.
3. 'strace' can decode numbers back into useful names when the numbers are unique.
4. People looking for ioctls can grep for them more easily when this convention is used to define the ioctl numbers.
5. When following the convention, the driver code can use generic code to copy the parameters between user and kernel space.

This table lists ioctls visible from user land for Linux/x86. It contains most drivers up to 2.6.31, but I know I am missing some. There has been no attempt to list non-X86 architectures or ioctls from drivers/staging/.
