

Sourcing from Builder.io

Builder.io has all the benefits of a modern headless CMS platform, plus the power of a drag and drop editor that enables everyone to edit more than just content. Builder.io + Gatsby empowers your entire team to create performant and fully customizable pages quickly.

Quick Start

Prerequisites

Make a free account over at Builder.io and grab your public API key from your organization page

Fresh project:

To start on a fresh project quickly, use the BuilderIO Gatsby starter

```
gatsby new my-builder-site https://github.com/BuilderIO/gatsby-starter-builder
```

Existing project:

Use `@builder.io/gatsby` plugin which will expose Builder.io data and optionally generate pages dynamically from a provided templates.

Query Builder.io data

The `@Builder.io/gatsby` plugin will add `allBuilderModels` to GraphQL, under which you can specify which model you'd like to get entries from.

For example to get the entries from your models `myHeader`, `myFooter`:

```
{
  allBuilderModels {
    myHeader(limit: 1, options: { cachebust: true }) {
      content
    }
    myFooter(limit: 1, options: { cachebust: true }) {
      content
    }
  }
}
```

```
    }  
  }  
}
```

Or you can query by urlPath for your page models:

```
query ($path: String!) {  
  allBuilderModels {  
    myPageModel(  
      target: { urlPath: $path }  
      limit: 1  
      options: { cachebust: true }  
    ) {  
      content  
    }  
  }  
}
```
