

npm-install-ci-test

Synopsis

`npm install-ci-test`

alias: `cit`

Description

This command runs `npm ci` followed immediately by `npm test`.

Configuration

audit

- Default: `true`
- Type: Boolean

When “true” submit audit reports alongside the current npm command to the default registry and all registries configured for scopes. See the documentation for `npm audit` for details on what is submitted.

foreground-scripts

- Default: `false`
- Type: Boolean

Run all build scripts (ie, `preinstall`, `install`, and `postinstall`) scripts for installed packages in the foreground process, sharing standard input, output, and error with the main npm process.

Note that this will generally make installs run slower, and be much noisier, but can be useful for debugging.

ignore-scripts

- Default: `false`
- Type: Boolean

If true, npm does not run scripts specified in package.json files.

Note that commands explicitly intended to run a particular script, such as `npm start`, `npm stop`, `npm restart`, `npm test`, and `npm run-script` will still run their intended script if `ignore-scripts` is set, but they will *not* run any pre- or post-scripts.

script-shell

- Default: `‘/bin/sh’` on POSIX systems, `‘cmd.exe’` on Windows
- Type: null or String

The shell to use for scripts run with the `npm exec`, `npm run` and `npm init <pkg>` commands.
