Zipkin data source

Grafana ships with built-in support for Zipkin, an open source, distributed tracing system. Just add it as a data source and you are ready to query your traces in [Explore]({{< relref "../explore" >}}).

Adding the data source

To access Zipkin settings, click the **Configuration** (gear) icon, then click **Data Sources > Zipkin**.

Name	Description
Name	The data source name in panels, queries, and Explore.
Default	The pre-selected data source for a new panel.
URL	The URL of the Zipkin instance. For example, <code>http://localhost:9411</code> .
Basic Auth	Enable basic authentication for the Zipkin data source.
User	Specify a user name for basic authentication.
Password	Specify a password for basic authentication.

Trace to logs

Note: This feature is available in Grafana 7.4+.

This is a configuration for the [trace to logs feature]({{< relref "../explore/trace-integration" >}}). Select target data source (at this moment limited to Loki or Splunk [logs] data sources) and select which tags will be used in the logs query.

- **Data source** - Target data source.
- **Tags** - The tags that will be used in the logs query. Default is `'cluster', 'hostname', 'namespace', 'pod'`.
- **Map tag names** - When enabled, allows configuring how Zipkin tag names map to logs label names. For example, map `service.name` to `service`.
- **Span start time shift** - Shift in the start time for the logs query based on the span start time. In order to extend to the past, you need to use a negative value. Use time interval units like 5s, 1m, 3h. The default is 0.
- **Span end time shift** - Shift in the end time for the logs query based on the span end time. Time units can be used here, for example, 5s, 1m, 3h. The default is 0.
- **Filter by Trace ID** - Toggle to append the trace ID to the logs query.
- **Filter by Span ID** - Toggle to append the span ID to the logs query.

Node Graph

This is a configuration for the beta Node Graph visualization. The Node Graph is shown after the trace view is loaded and is disabled by default.

-- **Enable Node Graph** - Enables the Node Graph visualization.

Query traces

Querying and displaying traces from Zipkin is available via [\[Explore\]](#) (`< relref "../explore" >`).

{{< figure src="/static/img/docs/v70/zipkin-query-editor.png" class="docs-image--no-shadow" caption="Screenshot of the Zipkin query editor" >}}

The Zipkin query editor allows you to query by trace ID directly or selecting a trace from trace selector. To query by trace ID, insert the ID into the text input.

{{< figure src="/static/img/docs/v70/zipkin-query-editor-open.png" class="docs-image--no-shadow" caption="Screenshot of the Zipkin query editor with trace selector expanded" >}}

Use the trace selector to pick particular trace from all traces logged in the time range you have selected in Explore. The trace selector has three levels of nesting:

1. The service you are interested in.
2. Particular operation is part of the selected service
3. Specific trace in which the selected operation occurred, represented by the root operation name and trace duration.

Data mapping in the trace UI

Zipkin annotations are shown in the trace view as logs with annotation value shown under annotation key.

Upload JSON trace file

You can upload a JSON file that contains a single trace to visualize it.

{{< figure src="/static/img/docs/explore/zipkin-upload-json.png" class="docs-image--no-shadow" caption="Screenshot of the Zipkin data source in explore with upload selected" >}}

Here is an example JSON:

```
[
  {
    "traceId": "efe9cb8857f68c8f",
    "parentId": "efe9cb8857f68c8f",
    "id": "8608dc6ce5cafe8e",
    "kind": "SERVER",
    "name": "get /api",
    "timestamp": 1627975249601797,
    "duration": 23457,
    "localEndpoint": { "serviceName": "backend", "ipv4": "127.0.0.1", "port": 9000 },
    "tags": {
      "http.method": "GET",
      "http.path": "/api",
      "jaxrs.resource.class": "Resource",
      "jaxrs.resource.method": "printDate"
    },
    "shared": true
  }
]
```

```
}  
]
```

Linking Trace ID from logs

You can link to Zipkin trace from logs in Loki or Splunk by configuring a derived field with internal link. See [Loki documentation]({{< relref "loki#derived-fields" >}}) for details.
