

placeholder=blur without blurDataURL

Why This Error Occurred

You are attempting use the `next/image` component with `placeholder=blur` property but no `blurDataURL` property.

The `blurDataURL` might be missing because you're using a string for `src` instead of a static import.

Or `blurDataURL` might be missing because the static import is an unsupported image format. Only jpg, png, webp, and avif are supported at this time.

Possible Ways to Fix It

- Add a `blurDataURL` property, the contents should be a small Data URL to represent the image
- Change the `src` property to a static import with one of the supported file types: jpg, png, or webp
- Remove the `placeholder` property, effectively no blur effect
