

Opt-out of Automatic Static Optimization

Why This Warning Occurred You are using `getInitialProps` in your Custom `<App>`.

This causes **all non-`getStaticProps` pages** to be executed on the server – disabling Automatic Static Optimization.

Possible Ways to Fix It Be sure you meant to use `getInitialProps` in `pages/_app`! There are some valid use cases for this, but it is often better to handle `getInitialProps` on a *per-page* basis.

Check for any higher-order components that may have added `getInitialProps` to your Custom `<App>`.

If you previously copied the Custom `<App>` example, you may be able to remove your `getInitialProps`.

The following `getInitialProps` does nothing and may be removed:

```
class MyApp extends App {
  // Remove me, I do nothing!
  static async getInitialProps({ Component, ctx }) {
    let pageProps = {}

    if (Component.getInitialProps) {
      pageProps = await Component.getInitialProps(ctx)
    }

    return { pageProps }
  }

  render() {
    // ...
  }
}
```
